- I propose instead to give an account of Maier's theorem and an overview of the necessary background which includes all of the above except 4.
- In addition we get an immediate proof of Linnik's theorem on the least prime in a.p.

- There is a standard probabilistic model for the primes due to Cramér [1936] which states that the probability that a number of size  $x$  is prime is  $1/\log x$ . This is known as the Cramér model of the primes.

- There is a standard probabilistic model for the primes due to Cramér [1936] which states that the probability that a number of size  $x$  is prime is  $1/\log x$ . This is known as the Cramér model of the primes.
- This predicts that if  $\lambda > 1$ , then

$$\pi(x + (\log x)^\lambda) - \pi(x) \sim (\log x)^{\lambda-1} \text{ as } x \rightarrow \infty.$$

- There is a standard probabilistic model for the primes due to Cramér [1936] which states that the probability that a number of size  $x$  is prime is  $1/\log x$ . This is known as the Cramér model of the primes.
- This predicts that if  $\lambda > 1$ , then

$$\pi(x + (\log x)^\lambda) - \pi(x) \sim (\log x)^{\lambda-1} \text{ as } x \rightarrow \infty.$$

- Maier [1985] showed that this breaks down for short intervals.

- There is a standard probabilistic model for the primes due to Cramér [1936] which states that the probability that a number of size  $x$  is prime is  $1/\log x$ . This is known as the Cramér model of the primes.
- This predicts that if  $\lambda > 1$ , then

$$\pi(x + (\log x)^\lambda) - \pi(x) \sim (\log x)^{\lambda-1} \text{ as } x \rightarrow \infty.$$

- Maier [1985] showed that this breaks down for short intervals.
- He proved that if  $\lambda > 1$ , then

$$\begin{aligned} \liminf_{x \rightarrow \infty} \frac{\pi(x + (\log x)^\lambda) - \pi(x)}{(\log x)^{\lambda-1}} &< 1 \\ &< \limsup_{x \rightarrow \infty} \frac{\pi(x + (\log x)^\lambda) - \pi(x)}{(\log x)^{\lambda-1}} \end{aligned}$$

- Maier showed that

## Theorem 1 (Maier)

Let  $\lambda > 1$  and  $\omega$  denote the Buchstab function,

$$\Omega^-(\lambda) = \inf\{\omega(\tau) : \tau > \lambda\}, \quad \Omega^+(\lambda) = \sup\{\omega(\tau) : \tau > \lambda\}.$$

Then

$$\limsup_{x \rightarrow \infty} \frac{\pi(x + (\log x)^\lambda) - \pi(x)}{(\log x)^{\lambda-1}} \geq e^{C_0} \Omega^+(\lambda)$$

and

$$\liminf_{x \rightarrow \infty} \frac{\pi(x + (\log x)^\lambda) - \pi(x)}{(\log x)^{\lambda-1}} \leq e^{C_0} \Omega^-(\lambda).$$

Moreover  $\Omega^-(\lambda) < e^{-C_0} < \Omega^+(\lambda)$ .

- The Buchstab function  $\omega(u)$  is defined for  $u \geq 1$  by

$$\omega(u) = \frac{1}{u} \quad (1 < u \leq 2), \quad (u\omega(u))' = \omega(u-1) \quad (u > 2)$$

and continuity at  $u = 2$ .

Background

The Buchstab  
Function

Exceptional  
Zeros

Distribution of  
Primes

Proof of  
Maier's  
Theorem

- The Buchstab function  $\omega(u)$  is defined for  $u \geq 1$  by

$$\omega(u) = \frac{1}{u} \quad (1 < u \leq 2), \quad (u\omega(u))' = \omega(u-1) \quad (u > 2)$$

and continuity at  $u = 2$ .

- Thus  $\omega(u) = \frac{1 + \log(u-1)}{u} \quad (2 < u \leq 3)$ .

- The Buchstab function  $\omega(u)$  is defined for  $u \geq 1$  by

$$\omega(u) = \frac{1}{u} \quad (1 < u \leq 2), \quad (u\omega(u))' = \omega(u-1) \quad (u > 2)$$

and continuity at  $u = 2$ .

- Thus  $\omega(u) = \frac{1 + \log(u-1)}{u} \quad (2 < u \leq 3)$ .
- Also, when  $2 < u \leq 3$  we have

$$\omega'(u) = \frac{1 - (u-1)\log(u-1)}{u^2(u-1)}$$

- The Buchstab function  $\omega(u)$  is defined for  $u \geq 1$  by

$$\omega(u) = \frac{1}{u} \quad (1 < u \leq 2), \quad (u\omega(u))' = \omega(u-1) \quad (u > 2)$$

and continuity at  $u = 2$ .

- Thus  $\omega(u) = \frac{1 + \log(u-1)}{u} \quad (2 < u \leq 3)$ .
- Also, when  $2 < u \leq 3$  we have

$$\omega'(u) = \frac{1 - (u-1)\log(u-1)}{u^2(u-1)}$$

- so that  $\omega'(2) = \frac{1}{4}$  and  $\omega'(3) = \frac{1-2\log 2}{18} < 0$ .

- The Buchstab function  $\omega(u)$  is defined for  $u \geq 1$  by

$$\omega(u) = \frac{1}{u} \quad (1 < u \leq 2), \quad (u\omega(u))' = \omega(u-1) \quad (u > 2)$$

and continuity at  $u = 2$ .

- Thus  $\omega(u) = \frac{1 + \log(u-1)}{u} \quad (2 < u \leq 3)$ .
- Also, when  $2 < u \leq 3$  we have

$$\omega'(u) = \frac{1 - (u-1)\log(u-1)}{u^2(u-1)}$$

- so that  $\omega'(2) = \frac{1}{4}$  and  $\omega'(3) = \frac{1-2\log 2}{18} < 0$ .
- Thus  $\exists u \in (2, 3)$  s.t.  $\omega'(u) = 0$  and  $\omega(u)$  has a local max.

- The Buchstab function  $\omega(u)$  is defined for  $u \geq 1$  by

$$\omega(u) = \frac{1}{u} \quad (1 < u \leq 2), \quad (u\omega(u))' = \omega(u-1) \quad (u > 2)$$

and continuity at  $u = 2$ .

- Thus  $\omega(u) = \frac{1 + \log(u-1)}{u}$  ( $2 < u \leq 3$ ).
- Also, when  $2 < u \leq 3$  we have

$$\omega'(u) = \frac{1 - (u-1)\log(u-1)}{u^2(u-1)}$$

- so that  $\omega'(2) = \frac{1}{4}$  and  $\omega'(3) = \frac{1-2\log 2}{18} < 0$ .
- Thus  $\exists u \in (2, 3)$  s.t.  $\omega'(u) = 0$  and  $\omega(u)$  has a local max.
- We also have for  $u > 2$

$$u\omega'(u) = \omega(u-1) - \omega(u) = - \int_{u-1}^u \omega'(v) dv$$

so  $\omega'(u)$  changes sign in every interval of length 1.

- The Buchstab function  $\omega(u)$  is defined for  $u \geq 1$  by

$$\omega(u) = \frac{1}{u} \quad (1 < u \leq 2), \quad (u\omega(u))' = \omega(u-1) \quad (u > 2)$$

and continuity at  $u = 2$ .

- Thus  $\omega(u) = \frac{1 + \log(u-1)}{u} \quad (2 < u \leq 3)$ .
- Also, when  $2 < u \leq 3$  we have

$$\omega'(u) = \frac{1 - (u-1)\log(u-1)}{u^2(u-1)}$$

- so that  $\omega'(2) = \frac{1}{4}$  and  $\omega'(3) = \frac{1-2\log 2}{18} < 0$ .
- Thus  $\exists u \in (2, 3)$  s.t.  $\omega'(u) = 0$  and  $\omega(u)$  has a local max.
- We also have for  $u > 2$

$$u\omega'(u) = \omega(u-1) - \omega(u) = - \int_{u-1}^u \omega'(v) dv$$

so  $\omega'(u)$  changes sign in every interval of length 1.

- It can also be shown that  $\lim_{u \rightarrow \infty} \omega(u) = e^{-C_0}$  where  $C_0$  is Euler's constant. For more details see Chapter 7 of MNT.

- The following lemma is particularly useful in the proof of Maier's theorem.

## Lemma 2 (de Bruijn)

*The function  $\omega(u) - e^{-C_0}$  changes sign in every interval  $[t - 1, t]$  with  $t \geq 2$ .*

- The following lemma is particularly useful in the proof of Maier's theorem.

## Lemma 2 (de Bruijn)

*The function  $\omega(u) - e^{-C_0}$  changes sign in every interval  $[t - 1, t]$  with  $t \geq 2$ .*

- Proof. Define  $\xi(u)$  for  $u > -1$  by

$$\xi(u) = \int_0^{\infty} \exp\left(-ux - x + \int_0^x \frac{e^{-y} - 1}{y} dy\right) dx.$$

- The following lemma is particularly useful in the proof of Maier's theorem.

## Lemma 2 (de Bruijn)

*The function  $\omega(u) - e^{-C_0}$  changes sign in every interval  $[t - 1, t]$  with  $t \geq 2$ .*

- Proof. Define  $\xi(u)$  for  $u > -1$  by

$$\xi(u) = \int_0^\infty \exp\left(-ux - x + \int_0^x \frac{e^{-y} - 1}{y} dy\right) dx.$$

- $\xi$  is differentiable for  $u > -1$  and by integration by parts

$$u\xi'(u - 1) + \xi(u) = 0.$$

- The following lemma is particularly useful in the proof of Maier's theorem.

## Lemma 2 (de Bruijn)

*The function  $\omega(u) - e^{-C_0}$  changes sign in every interval  $[t - 1, t]$  with  $t \geq 2$ .*

- Proof. Define  $\xi(u)$  for  $u > -1$  by

$$\xi(u) = \int_0^{\infty} \exp\left(-ux - x + \int_0^x \frac{e^{-y} - 1}{y} dy\right) dx.$$

- $\xi$  is differentiable for  $u > -1$  and by integration by parts

$$u\xi'(u - 1) + \xi(u) = 0.$$

- We also have  $\frac{1}{u+2} < \xi(u) < \frac{1}{u+1}$ .

- The following lemma is particularly useful in the proof of Maier's theorem.

## Lemma 2 (de Bruijn)

*The function  $\omega(u) - e^{-C_0}$  changes sign in every interval  $[t-1, t]$  with  $t \geq 2$ .*

- Proof. Define  $\xi(u)$  for  $u > -1$  by

$$\xi(u) = \int_0^{\infty} \exp\left(-ux - x + \int_0^x \frac{e^{-y} - 1}{y} dy\right) dx.$$

- $\xi$  is differentiable for  $u > -1$  and by integration by parts

$$u\xi'(u-1) + \xi(u) = 0.$$

- We also have  $\frac{1}{u+2} < \xi(u) < \frac{1}{u+1}$ .
- For  $t \geq 2$ , let  $\eta(t) = \int_{t-1}^t \omega(u)\xi(u)du + t\omega(t)\xi(t-1)$ .

- The following lemma is particularly useful in the proof of Maier's theorem.

## Lemma 2 (de Bruijn)

*The function  $\omega(u) - e^{-C_0}$  changes sign in every interval  $[t - 1, t]$  with  $t \geq 2$ .*

- Proof. Define  $\xi(u)$  for  $u > -1$  by

$$\xi(u) = \int_0^\infty \exp\left(-ux - x + \int_0^x \frac{e^{-y} - 1}{y} dy\right) dx.$$

- $\xi$  is differentiable for  $u > -1$  and by integration by parts

$$u\xi'(u - 1) + \xi(u) = 0.$$

- We also have  $\frac{1}{u+2} < \xi(u) < \frac{1}{u+1}$ .
- For  $t \geq 2$ , let  $\eta(t) = \int_{t-1}^t \omega(u)\xi(u)du + t\omega(t)\xi(t-1)$ .
- Then  $\eta'(t) = 0$  ( $t > 2$ ) and  $\lim_{t \rightarrow \infty} \eta(t) = e^{-C_0}$ .

- Hence

$$\int_{t-1}^t \omega(u)\xi(u)du + t\omega(t)\xi(t-1) = e^{-C_0} \quad (t \geq 2).$$

Background

The Buchstab  
Function

Exceptional  
Zeros

Distribution of  
Primes

Proof of  
Maier's  
Theorem

- Hence

$$\int_{t-1}^t \omega(u)\xi(u)du + t\omega(t)\xi(t-1) = e^{-C_0} \quad (t \geq 2).$$

- Let

$$\nu(t) = \int_{t-1}^t \xi(u)du + t\xi(t-1).$$

- Hence

$$\int_{t-1}^t \omega(u)\xi(u)du + t\omega(t)\xi(t-1) = e^{-C_0} \quad (t \geq 2).$$

- Let

$$\nu(t) = \int_{t-1}^t \xi(u)du + t\xi(t-1).$$

- Then  $\nu'(t) = 0$  ( $t > 0$ ). We also have  $\nu(t) \rightarrow 1$  as  $t \rightarrow \infty$ . Therefore

$$\int_{t-1}^t \xi(u)du + t\xi(t-1) = 1 \quad (t > 0)$$

and so

$$\int_{t-1}^t (\omega(u) - e^{-C_0})\eta(u)du + t(\omega(t) - e^{-C_0})\eta(t-1) = 0.$$

- Hence

$$\int_{t-1}^t \omega(u)\xi(u)du + t\omega(t)\xi(t-1) = e^{-C_0} \quad (t \geq 2).$$

- Let

$$\nu(t) = \int_{t-1}^t \xi(u)du + t\xi(t-1).$$

- Then  $\nu'(t) = 0$  ( $t > 0$ ). We also have  $\nu(t) \rightarrow 1$  as  $t \rightarrow \infty$ . Therefore

$$\int_{t-1}^t \xi(u)du + t\xi(t-1) = 1 \quad (t > 0)$$

and so

$$\int_{t-1}^t (\omega(u) - e^{-C_0})\eta(u)du + t(\omega(t) - e^{-C_0})\eta(t-1) = 0.$$

- Since  $\eta(t) > 0$  and  $\omega(u)$  is not a constant when  $2 \leq u \leq 3$ , then the lemma follows.

- We need good information about the distribution of primes in fairly short intervals.

Background

The Buchstab  
Function

Exceptional  
Zeros

Distribution of  
Primes

Proof of  
Maier's  
Theorem

- We need good information about the distribution of primes in fairly short intervals.
- Before establishing the requisite result we need to review some results which are not usually proved in Math 568.

- We need good information about the distribution of primes in fairly short intervals.
- Before establishing the requisite result we need to review some results which are not usually proved in Math 568.
- **Exceptional Zero Statement.** *By Corollary 11.10 of MNT there is a positive constant  $c_1$  such that*

$$F(s, T) = \prod_{q \leq T} \prod_{\chi \bmod q}^* L(s, \chi)$$

*has at most one zero  $s$  with  $\Re s > 1 - \frac{1}{c_1 \log T}$ , of necessity real and if this "exceptional zero"  $\beta_1$  exists, then the corresponding character  $\chi_1$  is quadratic and, by Corollary 11.12, there is a positive constant  $c_2$  such that  $\delta_1 = 1 - \beta_1$  satisfies*

$$\frac{1}{c_2 q_1^{1/2} (\log q_1)^2} \leq \delta_1 < \frac{1}{c_1 \log T}$$

*where  $q_1$  is the conductor of  $\chi_1$ .*

- It is convenient to write  $E_1 = 0$  if there is no exceptional zero and  $E_1 = 1$  if there is an exceptional zero and to reserve  $\chi_1, \beta_1, q_1$  to denote the corresponding exceptional character, zero and conductor.

- It is convenient to write  $E_1 = 0$  if there is no exceptional zero and  $E_1 = 1$  if there is an exceptional zero and to reserve  $\chi_1, \beta_1, q_1$  to denote the corresponding exceptional character, zero and conductor.

- Let

$$N^*(\theta, T)$$

denote the number of zeros  $\rho = \beta + i\gamma$  of  $F(s, T)$ , with  $\beta \geq \theta$  and  $|\gamma| \leq T$ , **other** than any exceptional zero.

- It is convenient to write  $E_1 = 0$  if there is no exceptional zero and  $E_1 = 1$  if there is an exceptional zero and to reserve  $\chi_1, \beta_1, q_1$  to denote the corresponding exceptional character, zero and conductor.

- Let

$$N^*(\theta, T)$$

denote the number of zeros  $\rho = \beta + i\gamma$  of  $F(s, T)$ , with  $\beta \geq \theta$  and  $|\gamma| \leq T$ , **other** than any exceptional zero.

- One can observe that if as  $T$  varies there are only a finite number of exceptional moduli, then in principle one could simply adjust the constant  $c_1$  and eliminate the concept of “exceptional”.

- It is convenient to write  $E_1 = 0$  if there is no exceptional zero and  $E_1 = 1$  if there is an exceptional zero and to reserve  $\chi_1, \beta_1, q_1$  to denote the corresponding exceptional character, zero and conductor.

- Let

$$N^*(\theta, T)$$

denote the number of zeros  $\rho = \beta + i\gamma$  of  $F(s, T)$ , with  $\beta \geq \theta$  and  $|\gamma| \leq T$ , **other** than any exceptional zero.

- One can observe that if as  $T$  varies there are only a finite number of exceptional moduli, then in principle one could simply adjust the constant  $c_1$  and eliminate the concept of “exceptional”.
- On the other hand if the exceptional moduli form an infinite sequence  $\{q_j\}$  and  $\{\beta_j\}$  are the corresponding exceptional zeros, then by the same token one would have to have

$$\limsup_{j \rightarrow \infty} (1 - \beta_j) \log q_j = 0.$$

- It is convenient to write  $E_1 = 0$  if there is no exceptional zero and  $E_1 = 1$  if there is an exceptional zero and to reserve  $\chi_1, \beta_1, q_1$  to denote the corresponding exceptional character, zero and conductor.

- Let

$$N^*(\theta, T)$$

denote the number of zeros  $\rho = \beta + i\gamma$  of  $F(s, T)$ , with  $\beta \geq \theta$  and  $|\gamma| \leq T$ , **other** than any exceptional zero.

- One can observe that if as  $T$  varies there are only a finite number of exceptional moduli, then in principle one could simply adjust the constant  $c_1$  and eliminate the concept of “exceptional”.
- On the other hand if the exceptional moduli form an infinite sequence  $\{q_j\}$  and  $\{\beta_j\}$  are the corresponding exceptional zeros, then by the same token one would have to have

$$\limsup_{j \rightarrow \infty} (1 - \beta_j) \log q_j = 0.$$

- So  $c_1$  could be taken to be as small as one pleases.

- We will probably have to skip the proof of the following.

### Theorem 3

*There are constants  $c > 0$ ,  $c_0 > 0$  so that for  $\frac{1}{2} \leq \theta \leq 1$  and  $T \geq 2$*

$$N^*(\theta, T) \leq c_0 T^{c(1-\theta)},$$

*and if there is an exceptional real zero  $\beta_1, \chi_1, q_1$ , then*

$$N^*(\theta, T) \leq c_0 \delta_1 (\log T) T^{c(1-\theta)}.$$

- We will probably have to skip the proof of the following.

### Theorem 3

*There are constants  $c > 0$ ,  $c_0 > 0$  so that for  $\frac{1}{2} \leq \theta \leq 1$  and  $T \geq 2$*

$$N^*(\theta, T) \leq c_0 T^{c(1-\theta)},$$

*and if there is an exceptional real zero  $\beta_1, \chi_1, q_1$ , then*

$$N^*(\theta, T) \leq c_0 \delta_1 (\log T) T^{c(1-\theta)}.$$

- This gives an effective Deuring-Heilbronn theorem.

### Corollary 4

*There are  $c_0 > 0$ ,  $c > 0$  so that if  $\beta_1$  is exceptional, then any other zero  $\rho = \beta + i\gamma$  with  $|\gamma| \leq T$  of  $F(s, T)$  satisfies*

$$\beta \leq 1 - \frac{\log \frac{1}{c_0(1-\beta_1) \log T}}{c \log T}.$$

- An important application of the above is

## Theorem 5 (Gallagher)

*There are constants  $c \geq 1$ ,  $\kappa_0 \geq 3$  so that if  $\kappa \geq \kappa_0$  is a constant and  $Q$  and  $x$  satisfy  $1 < Q^{6c} \leq x$ , then*

$$\sum_{q \leq Q} \sum_{\chi \bmod q}^* |\vartheta(x; \chi) - E_0(\chi)x| \ll x \exp\left(-\frac{\log x}{\kappa \log Q}\right) + \frac{x \log^2 x}{Q \log^2 Q}$$

*unless  $F(s, q) = \prod_{q \leq Q} \prod_{\chi \bmod q}^* L(s, \chi)$  has an exceptional zero  $\beta_1$*

*with  $1 - \beta_1 < \frac{1}{\kappa \log Q}$  when the general term on the left is*

*replaced by  $\left| \vartheta(x; \chi_1) + \frac{x^{\beta_1}}{\beta_1} \right|$  when  $\chi = \chi_1$  is the exceptional character, and the right hand side by*

$$(1 - \beta_1)(\log x) \left( x \exp\left(-\frac{\log x}{\log Q}\right) + \frac{x \log x}{Q \log Q} \right).$$

- The following two theorems are almost immediate

## Theorem 6 (Gallagher)

Suppose that  $1 < q^{6c} \leq x$ ,  $(a, q) = 1$ ,  $c, \kappa$  is as in Theorem 5 and that there is no exceptional zero  $\beta_1$  with  $1 - \beta_1 < \frac{1}{\kappa \log q}$ .

Then

$$\vartheta(x; q, a) = \frac{x}{\phi(q)} \left( 1 + O \left( \exp \left( -\frac{\log x}{\kappa \log q} \right) + \frac{\log^2 x}{q \log^2 q} \right) \right).$$

- The following two theorems are almost immediate

### Theorem 6 (Gallagher)

Suppose that  $1 < q^{6c} \leq x$ ,  $(a, q) = 1$ ,  $c, \kappa$  is as in Theorem 5 and that there is no exceptional zero  $\beta_1$  with  $1 - \beta_1 < \frac{1}{\kappa \log q}$ .

Then

$$\vartheta(x; q, a) = \frac{x}{\phi(q)} \left( 1 + O \left( \exp \left( -\frac{\log x}{\kappa \log q} \right) + \frac{\log^2 x}{q \log^2 q} \right) \right).$$

- Given  $q \in \mathbb{N}$  and  $a \in \mathbb{Z}$  with  $(q, a) = 1$  we define  $p(q, a)$  to be the least prime number  $p$  such that  $p \equiv a \pmod{q}$ .

### Theorem 7 (Linnik)

There is a positive constant  $A$  such that whenever  $q \in \mathbb{N}$ ,  $a \in \mathbb{Z}$  and  $(q, a) = 1$  we have  $p(q, a) \leq q^A$ .

- **Theorem 5.** *There are  $c \geq 1$ ,  $\kappa_0 \geq 3$  so if  $\kappa \geq \kappa_0$ ,  $Q^{6c} \leq x$ , then  $\sum_{q \leq Q} \sum_{\chi \bmod q}^* |\vartheta(x; \chi) - E_0(\chi)x|$*

$$\ll x \exp\left(-\frac{\log x}{\kappa \log Q}\right) + \frac{x \log^2 x}{Q \log^2 Q}$$

*unless there is a  $\beta_1 > 1 - \frac{1}{\kappa \log Q}$  when LHS with  $\chi = \chi_1$  is*

*$\left| \vartheta(x; \chi_1) + \frac{x^{\beta_1}}{\beta_1} \right|$  when  $\chi = \chi_1$  and the RHS is*

- **Theorem 5.** *There are  $c \geq 1$ ,  $\kappa_0 \geq 3$  so if  $\kappa \geq \kappa_0$ ,  $Q^{6c} \leq x$ , then 
$$\sum_{q \leq Q} \sum_{\chi \bmod q}^* |\vartheta(x; \chi) - E_0(\chi)x|$$*

$$\ll x \exp\left(-\frac{\log x}{\kappa \log Q}\right) + \frac{x \log^2 x}{Q \log^2 Q}$$

*unless there is a  $\beta_1 > 1 - \frac{1}{\kappa \log Q}$  when LHS with  $\chi = \chi_1$  is*

*$\left| \vartheta(x; \chi_1) + \frac{x^{\beta_1}}{\beta_1} \right|$  when  $\chi = \chi_1$  and the RHS is*

$$(1 - \beta_1)(\log x) \left( x \exp\left(-\frac{\log x}{\log Q}\right) + \frac{x \log x}{Q \log Q} \right).$$

- **Proof.** By MVvol1 or Math 568, when  $x \geq 2$ ,  $T \leq x^{1/2}$

$$\vartheta(x; \chi) = E_0(\chi)x - \sum_{\rho \in \mathcal{R}(\chi)} \frac{x^\rho}{\rho} + O\left(\frac{x}{T}(\log x)^2\right) \quad (0)$$

where  $\mathcal{R}(\chi) = \{\rho : L(\rho, \chi) = 0, \beta \geq \frac{1}{2}, |\gamma| \leq T\}$ .

- Let the constants  $c$ ,  $c_0$ ,  $c_1$ ,  $c_2$  be as in the Exceptional Zero Statement, Theorem 3 and Corollary 4, and let

$$\kappa_0 = 3 \max(c, c_1, c_0 e, 1, c_0 e^{3c}). \quad (1)$$

- Let the constants  $c$ ,  $c_0$ ,  $c_1$ ,  $c_2$  be as in the Exceptional Zero Statement, Theorem 3 and Corollary 4, and let

$$\kappa_0 = 3 \max(c, c_1, c_0 e, 1, c_0 e^{3c}). \quad (1)$$

- On hypothesis,  $\kappa \geq \kappa_0$  and it is convenient to write

$$\kappa' = \kappa/3.$$

- Let the constants  $c$ ,  $c_0$ ,  $c_1$ ,  $c_2$  be as in the Exceptional Zero Statement, Theorem 3 and Corollary 4, and let

$$\kappa_0 = 3 \max(c, c_1, c_0 e, 1, c_0 e^{3c}). \quad (1)$$

- On hypothesis,  $\kappa \geq \kappa_0$  and it is convenient to write

$$\kappa' = \kappa/3.$$

- Let

$$T = Q^3. \quad (2)$$

- Let the constants  $c$ ,  $c_0$ ,  $c_1$ ,  $c_2$  be as in the Exceptional Zero Statement, Theorem 3 and Corollary 4, and let

$$\kappa_0 = 3 \max(c, c_1, c_0 e, 1, c_0 e^{3c}). \quad (1)$$

- On hypothesis,  $\kappa \geq \kappa_0$  and it is convenient to write

$$\kappa' = \kappa/3.$$

- Let

$$T = Q^3. \quad (2)$$

- The proof divides into two cases.

- First we suppose that

$$F = F(s, T) = \prod_{q \leq T} \prod_{\chi \pmod q}^* L(s, \chi)$$

has no zeros  $\rho = \beta + i\gamma$  with  $|\gamma| \leq T$  and

$$\beta > 1 - \frac{1}{\kappa_0 \log T},$$

- First we suppose that

$$F = F(s, T) = \prod_{q \leq T} \prod_{\chi \bmod q}^* L(s, \chi)$$

has no zeros  $\rho = \beta + i\gamma$  with  $|\gamma| \leq T$  and

$$\beta > 1 - \frac{1}{\kappa_0 \log T},$$

- that is, either there are no exceptional zeros, or the exceptional zero exists but satisfies  $1 - \beta_1 \geq \frac{1}{\kappa_0 \log T}$ .

- First we suppose that

$$F = F(s, T) = \prod_{q \leq T} \prod_{\chi \bmod q}^* L(s, \chi)$$

has no zeros  $\rho = \beta + i\gamma$  with  $|\gamma| \leq T$  and

$$\beta > 1 - \frac{1}{\kappa_0 \log T},$$

- that is, either there are no exceptional zeros, or the exceptional zero exists but satisfies  $1 - \beta_1 \geq \frac{1}{\kappa_0 \log T}$ .

- By the explicit formula  $\sum_{q \leq Q} \sum_{\chi \bmod q}^* |\vartheta(x; \chi) - E_0(\chi)x|$

$$\ll QxT^{-1}(\log x)^2 + \sum_{q \leq Q} \sum_{\chi \bmod q}^* \sum_{\rho \in \mathcal{R}(\chi)} x^\beta.$$

- First we suppose that

$$F = F(s, T) = \prod_{q \leq T} \prod_{\chi \bmod q}^* L(s, \chi)$$

has no zeros  $\rho = \beta + i\gamma$  with  $|\gamma| \leq T$  and

$$\beta > 1 - \frac{1}{\kappa_0 \log T},$$

- that is, either there are no exceptional zeros, or the exceptional zero exists but satisfies  $1 - \beta_1 \geq \frac{1}{\kappa_0 \log T}$ .

- By the explicit formula  $\sum_{q \leq Q} \sum_{\chi \bmod q}^* |\vartheta(x; \chi) - E_0(\chi)x|$

$$\ll QxT^{-1}(\log x)^2 + \sum_{q \leq Q} \sum_{\chi \bmod q}^* \sum_{\rho \in \mathcal{R}(\chi)} x^\beta.$$

- We have  $x^\beta = x^{1/2} + \int_{1/2}^\beta x^u (\log x) du$  and so the above is

$$\leq x^{1/2} N^*(1/2, T) + \int_{1/2}^{1-1/(\kappa' \log T)} x^u N^*(u, T) (\log x) du.$$

- Thus 
$$\sum_{q \leq Q} \sum_{\chi \bmod q}^* |\vartheta(x; \chi) - E_0(\chi)x|$$
$$\leq x^{1/2} N^*(1/2, T) + \int_{1/2}^{1-1/(\kappa' \log T)} x^u N^*(u, T) (\log x) du.$$

- Thus 
$$\sum_{q \leq Q} \sum_{\chi \bmod q}^* |\vartheta(x; \chi) - E_0(\chi)x|$$
$$\leq x^{1/2} N^*(1/2, T) + \int_{1/2}^{1-1/(\kappa' \log T)} x^u N^*(u, T) (\log x) du.$$

- By Theorem 3 this is

$$\ll x^{1/2} T^{c/2} + \int_{1/2}^{1-1/(\kappa' \log T)} x^u T^{c(1-u)} (\log x) du.$$

By (2) and the hypothesis on  $x$ .

$$xT^{-c} = xQ^{-3c} \geq x^{1/2} \text{ and } x^{1/2} Q^{c/2} \leq x^{3/4}.$$

- Thus 
$$\sum_{q \leq Q} \sum_{\chi \bmod q}^* |\vartheta(x; \chi) - E_0(\chi)x|$$

$$\leq x^{1/2} N^*(1/2, T) + \int_{1/2}^{1-1/(\kappa' \log T)} x^u N^*(u, T) (\log x) du.$$

- By Theorem 3 this is

$$\ll x^{1/2} T^{c/2} + \int_{1/2}^{1-1/(\kappa' \log T)} x^u T^{c(1-u)} (\log x) du.$$

By (2) and the hypothesis on  $x$ .

$$xT^{-c} = xQ^{-3c} \geq x^{1/2} \text{ and } x^{1/2}Q^{c/2} \leq x^{3/4}.$$

- Hence the sum of interest is

$$\begin{aligned} &\ll xQ^{-2}(\log x)^2 + x^{1-1/(\kappa' \log T)} T^{c/(\kappa' \log T)} \\ &= xQ^{-2}(\log x)^2 + x \exp\left(-(\log x)/(\kappa' \log Q) + c/\kappa'\right) \\ &\ll xQ^{-2}(\log x)^2 + x \exp\left(-(\log x)/(\kappa \log Q) + c/\kappa'\right). \end{aligned}$$

- The remaining case is that in which there is an exceptional zero satisfying  $\beta_1 > 1 - (\kappa' \log T)^{-1}$ .

Background

The Buchstab  
Function

Exceptional  
Zeros

Distribution of  
Primes

Proof of  
Maier's  
Theorem

- The remaining case is that in which there is an exceptional zero satisfying  $\beta_1 > 1 - (\kappa' \log T)^{-1}$ .

- Now  $\vartheta(x, \chi) + E_1(\chi) \frac{x^{\beta_1}}{\beta_1} \ll xT^{-1}(\log x)^2 + \sum_{\rho \in \mathcal{R}^*(\chi)} x^\beta$

where  $\mathcal{R}^*(\chi)$  denotes the set of zeros  $\rho = \beta + i\gamma$  of  $L(s; \chi)$ , other than  $\beta_1$ , with  $|\gamma| \leq T$  and  $\beta \geq \frac{1}{2}$ .

- The remaining case is that in which there is an exceptional zero satisfying  $\beta_1 > 1 - (\kappa' \log T)^{-1}$ .

- Now  $\vartheta(x, \chi) + E_1(\chi) \frac{x^{\beta_1}}{\beta_1} \ll xT^{-1}(\log x)^2 + \sum_{\rho \in \mathcal{R}^*(\chi)} x^\beta$

where  $\mathcal{R}^*(\chi)$  denotes the set of zeros  $\rho = \beta + i\gamma$  of  $L(s; \chi)$ , other than  $\beta_1$ , with  $|\gamma| \leq T$  and  $\beta \geq \frac{1}{2}$ .

- The remaining case is that in which there is an exceptional zero satisfying  $\beta_1 > 1 - (\kappa' \log T)^{-1}$ .

- Now  $\vartheta(x, \chi) + E_1(\chi) \frac{x^{\beta_1}}{\beta_1} \ll x T^{-1} (\log x)^2 + \sum_{\rho \in \mathcal{R}^*(\chi)} x^\rho$

where  $\mathcal{R}^*(\chi)$  denotes the set of zeros  $\rho = \beta + i\gamma$  of  $L(s; \chi)$ , other than  $\beta_1$ , with  $|\gamma| \leq T$  and  $\beta \geq \frac{1}{2}$ .

- We can proceed as above, but now the multiple sum is

$$\begin{aligned} &\ll (1 - \beta_1)(\log T)x^{1/2} T^{c/2} \\ &\quad + \int_{1/2}^{1-\delta} (1 - \beta_1)(\log T)x^u T^{c(1-u)} du \end{aligned}$$

$$\ll (1 - \beta_1)(\log T)x^{1-\delta} T^{c\delta} \text{ where } \delta = \frac{\log \frac{1}{c_0(1-\beta_1) \log T}}{c \log T}$$

- The remaining case is that in which there is an exceptional zero satisfying  $\beta_1 > 1 - (\kappa' \log T)^{-1}$ .

- Now  $\vartheta(x, \chi) + E_1(\chi) \frac{x^{\beta_1}}{\beta_1} \ll x T^{-1} (\log x)^2 + \sum_{\rho \in \mathcal{R}^*(\chi)} x^\beta$

where  $\mathcal{R}^*(\chi)$  denotes the set of zeros  $\rho = \beta + i\gamma$  of  $L(s; \chi)$ , other than  $\beta_1$ , with  $|\gamma| \leq T$  and  $\beta \geq \frac{1}{2}$ .

- We can proceed as above, but now the multiple sum is

$$\ll (1 - \beta_1)(\log T)x^{1/2} T^{c/2} + \int_{1/2}^{1-\delta} (1 - \beta_1)(\log T)x^u T^{c(1-u)} du$$

$$\ll (1 - \beta_1)(\log T)x^{1-\delta} T^{c\delta} \text{ where } \delta = \frac{\log \frac{1}{c_0(1-\beta_1) \log T}}{c \log T}$$

- So, by the inequality for  $\delta_1$  in EZS, the sum is

$$\ll (1 - \beta_1) Q x T^{-1} (\log x)^2 + (1 - \beta_1)(\log x) x^{1-\delta} T^{c\delta}$$

$$\ll (1 - \beta_1)(\log x) \frac{x \log x}{Q \log Q} + (1 - \beta_1)(\log x) x^{1-\delta} T^{c\delta}.$$

- We have

$$\begin{aligned}x^{1-\delta} T^{c\delta} &= x \exp\left(\frac{\log(xT^{-c})}{c \log T} \log(c_0(1-\beta_1) \log T)\right) \\ &\leq x \exp\left(-\frac{\log x - 3c \log Q}{3c \log Q} \log(\kappa'/c_0)\right) \\ &\ll x \exp\left(-\frac{\log x - 3c \log Q}{\log Q}\right) \\ &\ll x \exp\left(-\frac{\log x}{\log Q}\right)\end{aligned}$$

and that completes the proof.

- As a consequence of Gallagher's theorem.

## Lemma 8

Let  $P(z) = \prod_{p \leq z} p$ . Then there are positive constants  $c$  and  $\kappa_0$  which have the property that when  $A > \max(2, 6c)$  and  $\kappa \in [\kappa_0, 2\kappa_0]$  there are arbitrarily large  $z > z_0(A, \kappa)$  such that whenever  $(a, P(z)) = 1$  we have

$$\begin{aligned} & \pi(2P(z)^A, P(z), a) - \pi(P(z)^A, P(z), a) \\ & - \frac{P(z)^A}{\phi(P(z)) (A \log P(z))} \ll \frac{P(z)^A \exp(-A/\kappa)}{\phi(P(z)) (A \log P(z))}. \end{aligned}$$

- As a consequence of Gallagher's theorem.

## Lemma 8

Let  $P(z) = \prod_{p \leq z} p$ . Then there are positive constants  $c$  and  $\kappa_0$  which have the property that when  $A > \max(2, 6c)$  and  $\kappa \in [\kappa_0, 2\kappa_0]$  there are arbitrarily large  $z > z_0(A, \kappa)$  such that whenever  $(a, P(z)) = 1$  we have

$$\begin{aligned} & \pi(2P(z)^A, P(z), a) - \pi(P(z)^A, P(z), a) \\ & - \frac{P(z)^A}{\phi(P(z))(A \log P(z))} \ll \frac{P(z)^A \exp(-A/\kappa)}{\phi(P(z))(A \log P(z))}. \end{aligned}$$

- Note that this is not for **every** large  $z$ , only some, perhaps very thin, subset of all large  $z$ .

- Proof. Let  $q = P(p_n)$ . If there is no exceptional zero  $\beta_1$  of

$$F_n(s) = \prod_{m|P(p_n)} \prod_{\chi \bmod m}^* L(s, \chi)$$

with  $\beta_1 > 1 - \frac{1}{\kappa_0 \log P(p_n)}$ , then we have, provided  $p_n$  is large enough in terms of  $A$  and  $\kappa_0$ .

$$\begin{aligned} & \vartheta(2P(p_n)^A, P(p_n), a) - \vartheta(P(p_n)^A, P(p_n), a) \\ & - \frac{P(p_n)^A}{\phi(P(p_n))} \ll \frac{P(p_n)^A \exp(-A/\kappa_0)}{\phi(P(p_n))}. \end{aligned}$$

- Proof. Let  $q = P(p_n)$ . If there is no exceptional zero  $\beta_1$  of

$$F_n(s) = \prod_{m|P(p_n)} \prod_{\chi \bmod m}^* L(s, \chi)$$

with  $\beta_1 > 1 - \frac{1}{\kappa_0 \log P(p_n)}$ , then we have, provided  $p_n$  is large enough in terms of  $A$  and  $\kappa_0$ .

$$\begin{aligned} & \vartheta(2P(p_n)^A, P(p_n), a) - \vartheta(P(p_n)^A, P(p_n), a) \\ & - \frac{P(p_n)^A}{\phi(P(p_n))} \ll \frac{P(p_n)^A \exp(-A/\kappa_0)}{\phi(P(p_n))}. \end{aligned}$$

- Moreover, for  $P(p_n)^A < p \leq 2P(p_n)^A$ , we have

$$\log p = A \log P(p_n) + O(1)$$

and the desired conclusion follows with  $z = p_n$ .

- Now suppose that there is an exceptional zero  $\beta_1$  of

$$F_n(s) = \prod_{m|P(p_n)} \prod_{\chi \bmod m}^* L(x, \chi)$$

satisfying  $\beta_1 > 1 - \frac{1}{\kappa_0 \log P(p_n)}$  and let  $q_1$  be the corresponding conductor.

- Now suppose that there is an exceptional zero  $\beta_1$  of

$$F_n(s) = \prod_{m|P(p_n)} \prod_{\chi \bmod m}^* L(x, \chi)$$

satisfying  $\beta_1 > 1 - \frac{1}{\kappa_0 \log P(p_n)}$  and let  $q_1$  be the corresponding conductor.

- Since

$$\log P(p_n) \ll \frac{1}{1 - \beta_1} \ll q_1^{1/2} \log q_1^2$$

$q_1$  is large in terms of  $n$ .

- Now suppose that there is an exceptional zero  $\beta_1$  of

$$F_n(s) = \prod_{m|P(p_n)} \prod_{\chi \bmod m}^* L(x, \chi)$$

satisfying  $\beta_1 > 1 - \frac{1}{\kappa_0 \log P(p_n)}$  and let  $q_1$  be the corresponding conductor.

- Since

$$\log P(p_n) \ll \frac{1}{1 - \beta_1} \ll q_1^{1/2} \log q_1^2$$

$q_1$  is large in terms of  $n$ .

- Now choose  $l$  minimally so that  $q_1 | P(p_l)$  and consider  $P(p_{l-1})$ . The  $l$  will also be large in terms of  $n$ , and  $\beta_1$  will satisfy

$$\beta_1 > 1 - \frac{1}{\kappa_0 \log P(p_l)},$$

so will be exceptional for  $F_l(s)$ .

- Now suppose that there is an exceptional zero  $\beta_1$  of

$$F_n(s) = \prod_{m|P(p_n)} \prod_{\chi \bmod m}^* L(x, \chi)$$

satisfying  $\beta_1 > 1 - \frac{1}{\kappa_0 \log P(p_n)}$  and let  $q_1$  be the corresponding conductor.

- Since

$$\log P(p_n) \ll \frac{1}{1 - \beta_1} \ll q_1^{1/2} \log q_1^2$$

$q_1$  is large in terms of  $n$ .

- Now choose  $l$  minimally so that  $q_1 | P(p_l)$  and consider  $P(p_{l-1})$ . The  $l$  will also be large in terms of  $n$ , and  $\beta_1$  will satisfy

$$\beta_1 > 1 - \frac{1}{\kappa_0 \log P(p_l)},$$

so will be exceptional for  $F_l(s)$ .

- Suppose that  $F_{l-1}(s)$  has an exceptional zero  $\beta_2$ , so that

$$\beta_2 > 1 - \frac{1}{\kappa_0 \log P(p_{l-1})}.$$

- Then the associated conductor will divide  $P(p_l)$  but by the minimality of  $l$  the exceptional conductor will differ from  $q_1$ .

- Then the associated conductor will divide  $P(p_l)$  but by the minimality of  $l$  the exceptional conductor will differ from  $q_1$ .
- But there cannot be a second exceptional zero of  $F_l(s)$ , so

$$\begin{aligned}\beta_2 &\leq 1 - \frac{1}{\kappa_0 \log P(p_l)} = 1 - \frac{1}{\kappa_0 (\log P(p_{l-1}) + \log p_l)} \\ &< 1 - \frac{1}{2\kappa_0 \log P(p_{l-1})}.\end{aligned}$$

- Then the associated conductor will divide  $P(p_l)$  but by the minimality of  $l$  the exceptional conductor will differ from  $q_1$ .
- But there cannot be a second exceptional zero of  $F_l(s)$ , so

$$\begin{aligned}\beta_2 &\leq 1 - \frac{1}{\kappa_0 \log P(p_l)} = 1 - \frac{1}{\kappa_0 (\log P(p_{l-1}) + \log p_l)} \\ &< 1 - \frac{1}{2\kappa_0 \log P(p_{l-1})}.\end{aligned}$$

- Thus there are no exceptional zeros of the kind

$$\beta_1 > 1 - \frac{1}{2\kappa_0 \log P(p_{l-1})}$$

associated with  $P(p_{l-1})$  and we can proceed as in the first part of the proof.

Background

The Buchstab  
FunctionExceptional  
ZerosDistribution of  
PrimesProof of  
Maier's  
Theorem

- **Theorem 1 (Maier).**  $\omega$  denotes the Buchstab function,

$$\Omega^-(\lambda) = \inf\{\omega(\tau) : \tau > \lambda\}, \quad \Omega^+(\lambda) = \sup\{\omega(\tau) : \tau > \lambda\}.$$

Then  $\limsup_{x \rightarrow \infty} \frac{\pi(x + (\log x)^\lambda) - \pi(x)}{(\log x)^{\lambda-1}} \geq e^{C_0} \Omega^+(\lambda)$  and

$\liminf_{x \rightarrow \infty} \frac{\pi(x + (\log x)^\lambda) - \pi(x)}{(\log x)^{\lambda-1}} \leq e^{C_0} \Omega^-(\lambda)$ . Moreover

$$\Omega^-(\lambda) < e^{-C_0} < \Omega^+(\lambda).$$

- Let  $\tau > \lambda$  and consider the array  $\mathfrak{M} = (a_{uv})$

$$(1 \leq u \leq P(z)^{A-1}, 1 \leq v \leq (A \log P(z))^\tau, (v, P(z)) = 1)$$

where  $a_{uv} = 1$  when  $uP(z)^{A-1} + v$  is prime and 0 otherwise.

Background

FunctionExceptional  
ZerosDistribution of  
PrimesProof of  
Maier's  
Theorem

- Let  $\tau > \lambda$  and consider the array  $\mathfrak{M} = (a_{uv})$

$$(1 \leq u \leq P(z)^{A-1}, 1 \leq v \leq (A \log P(z))^\tau, (v, P(z)) = 1)$$

where  $a_{uv} = 1$  when  $uP(z)^{A-1} + v$  is prime and 0 otherwise.

- By Lemma 8 (Gallagher), the number of non-zero entries in the  $v$ -th column is

$$\begin{aligned} & \pi(2P(z)^A, P(z), v) - \pi(P(z)^A, P(z), v) \\ &= \frac{P(z)^A}{\phi(P(z))A \log P(z)} (1 + O(\exp(-A/\kappa))) \quad (3) \end{aligned}$$

- We need to know the number of rows with non-zero entries.

Background

The Buchstab  
Function

Exceptional  
Zeros

Distribution of  
Primes

Proof of  
Maier's  
Theorem

- We need to know the number of rows with non-zero entries.
- That is the number of  $\nu$  with  $1 \leq \nu \leq (A \log P(z))^\tau$ ,  $(\nu, P(z)) = 1$ , so the number

$$\Phi((A \log P(z))^\tau, z)$$

- We need to know the number of rows with non-zero entries.
- That is the number of  $\nu$  with  $1 \leq \nu \leq (A \log P(z))^\tau$ ,  $(\nu, P(z)) = 1$ , so the number

$$\Phi((A \log P(z))^\tau, z)$$

- where  $\Phi$  is as in:

### Theorem 9 (Buchstab)

Let  $\Phi(x, y)$  denote the number of positive integers  $n \leq x$  composed entirely of prime numbers  $p \geq y$ , and let  $\omega(u)$  be Buchstab's function. Then

$$\Phi(x, y) = \frac{\omega(u)x}{\log y} - \frac{y}{\log y} + O\left(\frac{x}{(\log x)^2}\right)$$

uniformly for  $1 \leq u \leq U$  and all  $y \geq 2$ . Here  $u = (\log x)/\log y$ , i.e.  $y = x^{1/u}$ .

- Thus the total number of non-zero entries in the array is

$$\frac{P(z)^A \phi((A \log P(z))^\tau, z)}{\phi(P(z)) A \log P(z)} (1 + O(\exp(-A/\kappa))) =$$

$$\frac{P(z)^{A-1} (A \log(P(z)))^\tau \omega\left(\frac{\tau \log(A \log P(z))}{\log z}\right)}{A \log P(z) \prod_{p \leq z} (1 - 1/p)} (1 + O(")).$$

- Thus the total number of non-zero entries in the array is

$$\frac{P(z)^A \phi((A \log P(z))^\tau, z)}{\phi(P(z)) A \log P(z)} (1 + O(\exp(-A/\kappa))) =$$

$$\frac{P(z)^{A-1} (A \log(P(z)))^\tau \omega\left(\frac{\tau \log(A \log P(z))}{\log z}\right)}{A \log P(z) \prod_{p \leq z} (1 - 1/p)} (1 + O(")).$$

- Moreover, by the prime number theorem and Mertens,

$$\log P(z) = \vartheta(z) = z + O(z/\log z),$$

$$\log(A \log P(z)) = (\log z) (1 + O((\log A)(\log z)^{-1}))$$

$$\prod_{p \leq z} (1 - 1/p) = \frac{e^{-C_0}}{\log z} \left(1 + O\left(\frac{1}{\log z}\right)\right), \text{ so}$$

- Thus the total number of non-zero entries in the array is

$$\frac{P(z)^A \phi((A \log P(z))^\tau, z)}{\phi(P(z)) A \log P(z)} (1 + O(\exp(-A/\kappa))) =$$

$$\frac{P(z)^{A-1} (A \log(P(z)))^\tau \omega\left(\frac{\tau \log(A \log P(z))}{\log z}\right)}{A \log P(z) \prod_{p \leq z} (1 - 1/p)} (1 + O(")).$$

- Moreover, by the prime number theorem and Mertens,

$$\log P(z) = \vartheta(z) = z + O(z/\log z),$$

$$\log(A \log P(z)) = (\log z) (1 + O((\log A)(\log z)^{-1}))$$

$$\prod_{p \leq z} (1 - 1/p) = \frac{e^{-C_0}}{\log z} \left(1 + O\left(\frac{1}{\log z}\right)\right), \text{ so}$$

- $\omega(\tau \log(A \log P(z))/\log z) = \omega(\tau)(1 + O(\log A/\log z))$

- Thus the total number of non-zero entries in the array is

$$\frac{P(z)^A \phi((A \log P(z))^\tau, z)}{\phi(P(z)) A \log P(z)} (1 + O(\exp(-A/\kappa))) =$$

$$\frac{P(z)^{A-1} (A \log(P(z)))^\tau \omega\left(\frac{\tau \log(A \log P(z))}{\log z}\right)}{A \log P(z) \prod_{p \leq z} (1 - 1/p)} (1 + O(")).$$

- Moreover, by the prime number theorem and Mertens,

$$\log P(z) = \vartheta(z) = z + O(z/\log z),$$

$$\log(A \log P(z)) = (\log z) (1 + O((\log A)(\log z)^{-1}))$$

$$\prod_{p \leq z} (1 - 1/p) = \frac{e^{-C_0}}{\log z} \left(1 + O\left(\frac{1}{\log z}\right)\right), \text{ so}$$

- $\omega(\tau \log(A \log P(z))/\log z) = \omega(\tau)(1 + O(\log A/\log z))$
- and the total number of non-zero entries in the array is

$$\frac{P(z)^{A-1} (A \log(P(z)))^\tau e^{C_0} \omega(\tau)}{A \log P(z)} (1 + O(\exp(-A/\kappa))).$$

- The total number of non-zero entries in the array is

$$\frac{P(z)^{A-1} (A \log(P(z)))^\tau e^{C_0 \omega(\tau)}}{A \log P(z)} (1 + O(\exp(-A/\kappa))).$$

- The total number of non-zero entries in the array is

$$\frac{P(z)^{A-1} (A \log(P(z)))^\tau e^{C_0 \omega(\tau)}}{A \log P(z)} (1 + O(\exp(-A/\kappa))).$$

- The total number of rows is  $P(z)^{A-1}$ .

- The total number of non-zero entries in the array is

$$\frac{P(z)^{A-1} (A \log(P(z)))^\tau e^{C_0 \omega(\tau)}}{A \log P(z)} (1 + O(\exp(-A/\kappa))).$$

- The total number of rows is  $P(z)^{A-1}$ .
- Hence there are rows with  $\geq M$  non-zero entries where

$$M = \frac{(A \log(P(z)))^\tau e^{C_0 \omega(\tau)}}{A \log P(z)} (1 + O(\exp(-A/\kappa)))$$

- The total number of non-zero entries in the array is

$$\frac{P(z)^{A-1} (A \log(P(z)))^\tau e^{C_0 \omega(\tau)}}{A \log P(z)} (1 + O(\exp(-A/\kappa))).$$

- The total number of rows is  $P(z)^{A-1}$ .
- Hence there are rows with  $\geq M$  non-zero entries where

$$M = \frac{(A \log(P(z)))^\tau e^{C_0 \omega(\tau)}}{A \log P(z)} (1 + O(\exp(-A/\kappa)))$$

- By dividing the primes counted in these rows into  $N$  subintervals of length  $(A \log(P(z)))^\tau N^{-1}$  where  $N = \lceil (A \log(P(z)))^{\tau-\lambda} \rceil$  we find that there are intervals  $(X, X + (A \log(P(z)))^\tau N^{-1}]$  containing  $\geq \frac{(A \log(P(z)))^\lambda e^{C_0 \omega(\tau)}}{A \log P(z)} (1 + O(\exp(-A/\kappa)))$  primes where  $P(z)^A \leq X \leq 2P(z)^A + (A \log P(z))^\tau$ .

- Intervals  $(X, X + (A \log(P(z)))^\tau N^{-1}]$ , with  $N = \lceil (A \log(P(z)))^{\tau-\lambda} \rceil$ , containing 
$$\geq \frac{(A \log(P(z)))^\lambda e^{C_0 \omega(\tau)}}{A \log P(z)} (1 + O(\exp(-A/\kappa)))$$
 primes where  $P(z)^A \leq X \leq 2P(z)^A + (A \log P(z))^\tau$ .

- Intervals  $(X, X + (A \log(P(z)))^\tau N^{-1}]$ , with  $N = \lceil (A \log(P(z)))^{\tau-\lambda} \rceil$ , containing  $\geq \frac{(A \log(P(z)))^\lambda e^{C_0 \omega(\tau)}}{A \log P(z)} (1 + O(\exp(-A/\kappa)))$  primes where  $P(z)^A \leq X \leq 2P(z)^A + (A \log P(z))^\tau$ .

- The length of such intervals is at most

$$(A \log P(z))^\lambda \leq (\log X)^\lambda.$$

- Intervals  $(X, X + (A \log(P(z)))^\tau N^{-1}]$ , with  $N = \lceil (A \log(P(z)))^{\tau-\lambda} \rceil$ , containing  $\geq \frac{(A \log(P(z)))^\lambda e^{C_0 \omega(\tau)}}{A \log P(z)} (1 + O(\exp(-A/\kappa)))$  primes where  $P(z)^A \leq X \leq 2P(z)^A + (A \log P(z))^\tau$ .

- The length of such intervals is at most

$$(A \log P(z))^\lambda \leq (\log X)^\lambda.$$

- Moreover

$$A \log P(z) = \log X + O(1)$$

- Intervals  $(X, X + (A \log(P(z)))^\tau N^{-1}]$ , with  $N = \lceil (A \log(P(z)))^{\tau-\lambda} \rceil$ , containing 
$$\geq \frac{(A \log(P(z)))^\lambda e^{C_0 \omega(\tau)}}{A \log P(z)} (1 + O(\exp(-A/\kappa)))$$
 primes where  $P(z)^A \leq X \leq 2P(z)^A + (A \log P(z))^\tau$ .

- The length of such intervals is at most

$$(A \log P(z))^\lambda \leq (\log X)^\lambda.$$

- Moreover

$$A \log P(z) = \log X + O(1)$$

- Thus it follows that there are arbitrarily large  $X$  such that

$$\begin{aligned} \pi(X + (\log X)^\lambda) - \pi(X) \\ \geq e^{C_0 \omega(\tau)} (\log X)^{\lambda-1} (1 + O(\exp(-A/\kappa))). \end{aligned}$$

- In the opposite direction, there are rows with at most

$$\frac{(A \log(P(z)))^\tau e^{C_0 \omega(\tau)}}{A \log P(z)} (1 + O(\exp(-A/\kappa)))$$

non-zero entries.

- In the opposite direction, there are rows with at most

$$\frac{(A \log(P(z)))^\tau e^{C_0 \omega(\tau)}}{A \log P(z)} (1 + O(\exp(-A/\kappa)))$$

non-zero entries.

- The choice  $N = \left\lfloor \frac{(A \log(P(z)))^\tau}{(\log(2P(z)^A + (A \log P(z))^\tau))^\lambda} \right\rfloor$  produces intervals  $\left( X, X + \frac{(A \log(P(z)))^\tau}{N} \right]$  of length at least  $(\log(2P(z)^A + (A \log P(z))^\tau))^\lambda \geq (\log X)^\lambda$  containing  $\leq e^{C_0 \omega(\tau)} (\log X)^{\lambda-1} (1 + O(\exp(-A/\kappa)))$  primes.

- In the opposite direction, there are rows with at most

$$\frac{(A \log(P(z)))^\tau e^{C_0 \omega(\tau)}}{A \log P(z)} (1 + O(\exp(-A/\kappa)))$$

non-zero entries.

- The choice  $N = \left\lfloor \frac{(A \log(P(z)))^\tau}{(\log(2P(z)^A + (A \log P(z))^\tau))^\lambda} \right\rfloor$  produces intervals  $\left( X, X + \frac{(A \log(P(z)))^\tau}{N} \right]$  of length at least  $(\log(2P(z)^A + (A \log P(z))^\tau))^\lambda \geq (\log X)^\lambda$  containing  $\leq e^{C_0 \omega(\tau)} (\log X)^{\lambda-1} (1 + O(\exp(-A/\kappa)))$  primes.
- Thus it follows that there are arbitrarily large  $X$  such that

$$\begin{aligned} \pi(X + (\log X)^\lambda) - \pi(X) \\ \leq e^{C_0 \omega(\tau)} (\log X)^{\lambda-1} (1 + O(\exp(-A/\kappa))). \end{aligned}$$

The theorem now follows.
