Arithmetical Functions

Averages of arithmetica functions

Elementary Prime number

Orders of magnitude of arithmetical functions

 Since I are not sure of the number theory background of everyone in the class I will start by discussing some useful topics from elementary number theory.

Arithmetical Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

ullet The set ${\mathcal A}$ of arithmetical functions is defined by

$$\mathcal{A} = \{ f : \mathbb{N} \to \mathbb{C} \}.$$

Arithmetical Functions

Arithmetical Functions

Averages of arithmetica functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions

Some examples are

Averages of arithmetical functions

Elementary
Prime number
theory

Orders of magnitude of arithmetical functions

- Some examples are
- **The divisor function**. The number of positive divisors of *n*.

$$d(n) = \sum_{m|n} 1.$$

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

- Some examples are
- The divisor function. The number of positive divisors of n.

$$d(n)=\sum_{m|n}1.$$

• Euler's function. The number $\phi(n)$ of integers m with $1 \le m \le n$ and (m,n) = 1. This is important because it counts the number of units in $\mathbb{Z}/n\mathbb{Z}$.

Averages of arithmetica functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

• Euler's function satisfies an interesting relationship.

Theorem 1

We have
$$\sum_{m|n} \phi(m) = n$$
.

Averages of arithmetical functions

Elementary
Prime number theory

Orders of magnitude of arithmetical functions.

• Euler's function satisfies an interesting relationship.

Theorem 1

We have
$$\sum_{m|n} \phi(m) = n$$
.

One way of seeing this is as follows. Consider the n fractions

$$\frac{1}{n}, \frac{2}{n}, \ldots, \frac{n}{n}.$$

Elementary Prime number theory

Orders of magnitude o arithmetical functions

• Euler's function satisfies an interesting relationship.

Theorem 1

We have $\sum_{m|n} \phi(m) = n$.

One way of seeing this is as follows. Consider the n fractions

$$\frac{1}{n}, \frac{2}{n}, \ldots, \frac{n}{n}$$
.

 Then factor out any common factors between denominators and numerators. Then one will obtain each fraction of the form

$$\frac{I}{n}$$

with $m|n, 1 \le l \le m$ and (l, m) = 1.

Elementary Prime number theory

Orders of magnitude o arithmetical functions

• Euler's function satisfies an interesting relationship.

Theorem 1

We have $\sum_{m|n} \phi(m) = n$.

One way of seeing this is as follows. Consider the n fractions

$$\frac{1}{n}, \frac{2}{n}, \ldots, \frac{n}{n}.$$

 Then factor out any common factors between denominators and numerators. Then one will obtain each fraction of the form

$$\frac{I}{m}$$

with $m|n, 1 \le l \le m$ and (l, m) = 1.

The number of such fractions is

$$\sum_{m|n} \phi(m).$$

Averages of arithmetical functions

Elementary
Prime number
theory

Orders of magnitude of arithmetical functions.

• The Möbius function. This is a more peculiar function. It is defined to be

$$\mu(n) = (-1)^k$$

when $n = p_1 \dots p_k$ and the p_j are distinct, and is defined to be 0 otherwise.

 Two other functions which have interesting structures but which we will say less about at this stage are

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude or arithmetical functions.

- Two other functions which have interesting structures but which we will say less about at this stage are
- The primitive character modulo 4. We define

$$\chi_1(n) = \begin{cases} (-1)^{\frac{n-1}{2}} & 2 \nmid n, \\ 0 & 2 \mid n. \end{cases}$$

 Sums of two squares. We define r(n) to be the number of ways of writing n as the sum of two squares of integers.

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

- Two other functions which have interesting structures but which we will say less about at this stage are
- The primitive character modulo 4. We define

$$\chi_1(n) = \begin{cases} (-1)^{\frac{n-1}{2}} & 2 \nmid n, \\ 0 & 2 \mid n. \end{cases}$$

- Sums of two squares. We define r(n) to be the number of ways of writing n as the sum of two squares of integers.
- For example, $1 = 0^2 + (\pm 1)^2 = (\pm 1)^2 + 0^2$, so r(1) = 4, r(3) = r(6) = r(7) = 0, r(9) = 4, $65 = (\pm 1)^2 + (\pm 8)^2 = (\pm 4)^2 + (\pm 7)^2$ so r(65) = 16.

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

- Two other functions which have interesting structures but which we will say less about at this stage are
- The primitive character modulo 4. We define

$$\chi_1(n) = \begin{cases} (-1)^{\frac{n-1}{2}} & 2 \nmid n, \\ 0 & 2 \mid n. \end{cases}$$

- Sums of two squares. We define r(n) to be the number of ways of writing n as the sum of two squares of integers.
- For example, $1 = 0^2 + (\pm 1)^2 = (\pm 1)^2 + 0^2$, so r(1) = 4, r(3) = r(6) = r(7) = 0, r(9) = 4, $65 = (\pm 1)^2 + (\pm 8)^2 = (\pm 4)^2 + (\pm 7)^2$ so r(65) = 16.
- d, ϕ , e, $\mathbf{1}$, N, χ_1 have an interesting property. That is they are multiplicative.

Arithmetical Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

• **Definition** An arithmetical function f which is not identically 0 is **multiplicative** when it satisfies

$$f(mn) = f(m)f(n)$$

whenever
$$(m, n) = 1$$
.

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

• **Definition** An arithmetical function f which is not identically 0 is **multiplicative** when it satisfies

$$f(mn) = f(m)f(n)$$

whenever (m, n) = 1.

• Let $\mathcal M$ denote the set of multiplicative functions.

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

• **Definition** An arithmetical function f which is not identically 0 is **multiplicative** when it satisfies

$$f(mn) = f(m)f(n)$$

whenever (m, n) = 1.

- Let $\mathcal M$ denote the set of multiplicative functions.
- The function r(n) is not multiplicative, since r(65) = 16 but r(5) = r(13) = 8.

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude or arithmetical functions.

• **Definition** An arithmetical function f which is not identically 0 is **multiplicative** when it satisfies

$$f(mn) = f(m)f(n)$$

whenever (m, n) = 1.

- Let \mathcal{M} denote the set of multiplicative functions.
- The function r(n) is not multiplicative, since r(65) = 16 but r(5) = r(13) = 8.
- Indeed the fact that $r(1) \neq 1$ would contradict the next theorem.

Orders of magnitude o arithmetical functions.

• **Definition** An arithmetical function f which is not identically 0 is **multiplicative** when it satisfies

$$f(mn) = f(m)f(n)$$

whenever (m, n) = 1.

- Let \mathcal{M} denote the set of multiplicative functions.
- The function r(n) is not multiplicative, since r(65) = 16 but r(5) = r(13) = 8.
- Indeed the fact that $r(1) \neq 1$ would contradict the next theorem.
- However it is true that r(n)/4 is multiplicative, but this is a little trickier to prove.

Arithmetical Functions

Averages of arithmetica functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions

• We have

Theorem 2

Suppose that $f \in \mathcal{M}$. Then f(1) = 1.

Averages of arithmetica functions

Elementary Prime number theory

Orders of magnitude o arithmetical

We have

Theorem 2

Suppose that $f \in \mathcal{M}$. Then f(1) = 1.

• The proof is easy.

Proof.

Since f is not identically 0 there is an n such that $f(n) \neq 0$. Hence $f(n) = f(n \times 1) = f(n)f(1)$, and the conclusion follows.

Arithmetical Functions

Averages of arithmetical functions

Elementary Prime number

Orders of magnitude of arithmetical functions

• It is pretty obvious that e, $\mathbf{1}$ and N are in \mathcal{M} , and it is actually quite easy to show

Theorem 3

We have $\mu \in \mathcal{M}$.

Averages of arithmetical functions

Elementary
Prime number theory

Orders of magnitude o arithmetical functions.

• It is pretty obvious that e, $\mathbf{1}$ and N are in \mathcal{M} , and it is actually quite easy to show

Theorem 3

We have $\mu \in \mathcal{M}$.

Proof.

Suppose that (m, n) = 1. If $p^2|mn$, then $p^2|m$ or $p^2|n$, so $\mu(mn) = 0 = \mu(m)\mu(n)$. If

$$m = p_1 \dots p_k, \quad n = p'_1 \dots p'_l$$

with the p_i, p'_i distinct, then

$$\mu(mn) = (-1)^{k+l} = (-1)^k (-1)^l = \mu(m)\mu(n).$$

Averages of arithmetical functions

Elementary Prime number

Orders of magnitude of arithmetical functions

• The following is very useful.

Theorem 4

Suppose the $f \in \mathcal{M}$, $g \in \mathcal{M}$ and h is defined for each n by $h(n) = \sum_{m|n} f(m)g(n/m)$. Then $h \in \mathcal{M}$.

Averages of arithmetical functions

Elementary Prime numbe theory

Orders of magnitude of arithmetical functions.

• The following is very useful.

Theorem 4

Suppose the $f \in \mathcal{M}$, $g \in \mathcal{M}$ and h is defined for each n by $h(n) = \sum_{m|n} f(m)g(n/m)$. Then $h \in \mathcal{M}$.

Proof.

Suppose $(n_1, n_2) = 1$. Then a typical divisor m of $n_1 n_2$ is uniquely of the form $m_1 m_2$ with $m_1 | n_1$ and $m_2 | n_2$. Hence

$$h(n_1n_2) = \sum_{m_1|n_1} \sum_{m_2|n_2} f(m_1m_2)g(n_1n_2/(m_1m_2))$$

 $= \sum_{m_1|n_1} f(m_1)g(n_1/m_1) \sum_{m_2|n_2} f(m_2)g(n_2/m_2).$

Averages of arithmetical functions

Elementary
Prime number

Orders of magnitude of arithmetical functions.

 This enables is to establish an interesting property of the Möbius function.

Theorem 5

We have

$$\sum_{m|n}\mu(m)=e(n).$$

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

 This enables is to establish an interesting property of the Möbius function.

Theorem 5

We have

$$\sum_{m|n}\mu(m)=e(n).$$

Proof.

By the previous theorem the sum here is $\sum_{m|n} \mu(m) \mathbf{1}(n/m)$ is in \mathcal{M} . Moreover if $k \geq 1$, then

$$\sum_{m|p^k} \mu(m) = \mu(1) + \mu(p) = 1 - 1 = 0$$

Arithmetical Functions

Averages of arithmetical functions

Elementary Prime numbe theory

Orders of magnitude of arithmetical functions.

This suggests a general way of defining new functions.
 Definition. Given two arithmetical functions f and g we define the Dirichlet convolution f * g to be the function defined by

$$(f*g)(n) = \sum_{m|n} f(m)g(n/m).$$

Arithmetical Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

• This suggests a general way of defining new functions. **Definition.** Given two arithmetical functions f and g we define the **Dirichlet convolution** $f \ast g$ to be the function defined by

$$(f*g)(n) = \sum_{m|n} f(m)g(n/m).$$

 Note that this operation is commutative - simply replace m by n/m.

Arithmetical Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

• This suggests a general way of defining new functions. **Definition.** Given two arithmetical functions f and g we define the **Dirichlet convolution** $f \ast g$ to be the function defined by

$$(f*g)(n) = \sum_{m|n} f(m)g(n/m).$$

- Note that this operation is commutative simply replace m by n/m.
- It is also quite easy to see that

$$(f*g)*h=f*(g*h).$$

Arithmetical Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude or arithmetical functions.

• This suggests a general way of defining new functions. **Definition.** Given two arithmetical functions f and g we define the **Dirichlet convolution** $f \ast g$ to be the function defined by

$$(f*g)(n) = \sum_{m|n} f(m)g(n/m).$$

- Note that this operation is commutative simply replace m by n/m.
- It is also quite easy to see that

$$(f*g)*h=f*(g*h).$$

Write the left hand side as

$$\sum_{m|n} \left(\sum_{l|m} f(l)g(m/l) \right) h(n/m)$$

and interchange the order of summation and replace m by kl.

- 2. $\mu * \mathbf{1} = \mathbf{1} * \mu = e$, so μ is the inverse of $\mathbf{1}$, and *vice versa*.
- 3. d = 1 * 1, so $d \in \mathcal{M}$. Hence
- 4. $d(p^k) = k+1$ and $d(p_1^{k_1} \dots p_r^{k_r}) = (k_1+1) \dots (k_r+1)$.

Arithmetical Functions

Averages of arithmetica functions

Elementary Prime numbe

Orders of magnitude of arithmetical functions.

The Möbius function has other interesting properties.

Theorem 6 (Möbius inversion I)

Suppose that $f \in A$ and g = f * 1. Then $f = g * \mu$.

Elementary Prime numbe theory

Orders of magnitude o arithmetical functions.

The Möbius function has other interesting properties.

Theorem 6 (Möbius inversion I)

Suppose that $f \in A$ and g = f * 1. Then $f = g * \mu$.

• Using Dirichlet convolution the proof is easy.

Proof.

We have

$$g * \mu = (f * \mathbf{1}) * \mu = f * (\mathbf{1} * \mu) = f * e = f.$$

Elementary Prime numbe theory

Orders of magnitude o arithmetical functions.

• The Möbius function has other interesting properties.

Theorem 6 (Möbius inversion I)

Suppose that $f \in A$ and g = f * 1. Then $f = g * \mu$.

• Using Dirichlet convolution the proof is easy.

Proof.

We have

$$g * \mu = (f * \mathbf{1}) * \mu = f * (\mathbf{1} * \mu) = f * e = f.$$

• There is a converse theorem

Theorem 7 (Möbius inversion II)

Suppose that $g \in A$ and $f = g * \mu$, then $g = f * \mathbf{1}$.

Elementary Prime numbe theory

Orders of magnitude o arithmetical functions.

• The Möbius function has other interesting properties.

Theorem 6 (Möbius inversion I)

Suppose that $f \in A$ and g = f * 1. Then $f = g * \mu$.

• Using Dirichlet convolution the proof is easy.

Proof.

We have

$$g * \mu = (f * \mathbf{1}) * \mu = f * (\mathbf{1} * \mu) = f * e = f.$$

There is a converse theorem

Theorem 7 (Möbius inversion II)

Suppose that $g \in A$ and $f = g * \mu$, then g = f * 1.

The proof is similar.

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

There are some interesting consequences

Theorem 8

We have $\phi = \mu * N$ and $\phi \in \mathcal{M}$. Moreover

$$\phi(n) = n \sum_{m|n} \frac{\mu(m)}{m} = n \prod_{p|n} \left(1 - \frac{1}{p}\right)$$

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

• There are some interesting consequences

Theorem 8

We have $\phi = \mu * N$ and $\phi \in \mathcal{M}$. Moreover

$$\phi(n) = n \sum_{m|n} \frac{\mu(m)}{m} = n \prod_{p|n} \left(1 - \frac{1}{p}\right)$$

Again the proof is easy.

Proof.

We saw in Theorem 1 that $\phi * \mathbf{1} = N$. Hence by the previous theorem we have $\phi = N * \mu = \mu * N$. Therefore, by Theorem 4, $\phi \in \mathcal{M}$. Moreover $\phi(p^k) = p^k - p^{k-1}$ and we are done. \square

Arithmetical Functions

Averages of arithmetical functions

Elementary Prime numbe theory

Orders of magnitude o arithmetical

A structure theorem.

Theorem 9

Let
$$\mathcal{D}=\{f\in\mathcal{A}:f(1)\neq 0\}.$$
 Then $\langle\mathcal{D},*\rangle$ is an abelian group.

Arithmetical Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude o arithmetical functions

A structure theorem.

Theorem 9

Let $\mathcal{D} = \{ f \in \mathcal{A} : f(1) \neq 0 \}$. Then $\langle \mathcal{D}, * \rangle$ is an abelian group.

• The proof is constructive.

Proof.

Of course e is the unit, and closure is obvious. We already checked commutativity and associativity. It remains, given $f \in \mathcal{D}$, to construct an inverse. Define g iteratively by g(1) = 1/f(1), $g(n) = -\sum_{\substack{m|n \ m>1}} f(m)g(n/m)/f(1)$ and it is

clear that
$$f * g = e$$
.

- Thus when we sum over $n \le X$ we are just counting the number of ordered pairs m, l such that $ml \le X$.
- In other words we are counting the number of *lattice* points m, l under the rectangular hyperbola

$$xy = X$$
.

• We could just crudely count, given $m \le X$, the number of choices for I, namely

$$\frac{X}{m}$$

and obtain

$$\sum_{m \leq X} \frac{X}{m} + O(X)$$

but this gives a much weaker error term.

Math 571 Chapter 1 Elementary Results

Robert C. Vaughan

Arithmetica Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

• Dirichlet's idea is divide the region under the hyperbola into two parts using its symmetry in the line y=x.

Arithmetica Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

- Dirichlet's idea is divide the region under the hyperbola into two parts using its symmetry in the line y = x.
- That two regions are the part with

$$m \le \sqrt{X}, \ l \le \frac{X}{m}$$

and that with

$$1 \le \sqrt{X}, \ m \le \frac{X}{I}.$$

Prime number theory

Orders of magnitude or arithmetical functions.

- Dirichlet's idea is divide the region under the hyperbola into two parts using its symmetry in the line y = x.
- That two regions are the part with

$$m \le \sqrt{X}, \ l \le \frac{X}{m}$$

and that with

$$1 \le \sqrt{X}, \ m \le \frac{X}{I}.$$

• Clearly each region has the same number of lattice points. However the points m, l with $m \le \sqrt{X}$ and $l \le \sqrt{X}$ are counted in both regions.

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

Thus we obtain

$$\sum_{n \le X} d(n) = 2 \sum_{m \le \sqrt{X}} \left\lfloor \frac{X}{m} \right\rfloor - \lfloor \sqrt{X} \rfloor^2$$

$$= 2 \sum_{m \le \sqrt{X}} \frac{X}{m} - X + O(X^{1/2})$$

$$= 2X \left(\log(\sqrt{X}) + C \right) - X + O(X^{1/2}).$$

where in the last line we used Euler's estimate for S(x).

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

One can also compute an average for Euler's function

Theorem 11

Suppose that $x \in \mathbb{R}$ and $x \ge 2$. Then

$$\sum_{n\leq x}\phi(n)=\frac{x^2}{2}\sum_{m=1}^{\infty}\frac{\mu(m)}{m^2}+O(x\log x).$$

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

One can also compute an average for Euler's function

Theorem 11

Suppose that $x \in \mathbb{R}$ and $x \ge 2$. Then

$$\sum_{n \le x} \phi(n) = \frac{x^2}{2} \sum_{m=1}^{\infty} \frac{\mu(m)}{m^2} + O(x \log x).$$

• We remark that the infinite series here is "well known" to be $\frac{6}{\pi^2}$.

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

One can also compute an average for Euler's function

Theorem 11

Suppose that $x \in \mathbb{R}$ and $x \ge 2$. Then

$$\sum_{n\leq x}\phi(n)=\frac{x^2}{2}\sum_{m=1}^{\infty}\frac{\mu(m)}{m^2}+O(x\log x).$$

- We remark that the infinite series here is "well known" to be $\frac{6}{\pi^2}$.
- We leave the proof largely to the class as homework.
- Hint: Use $\phi = \mu * N$ to obtain

$$\sum_{n \le x} \phi(n) = \sum_{n \le x} n \sum_{m \mid n} \frac{\mu(m)}{m} = \sum_{m \le x} \mu(m) \sum_{l \le x/m} l$$

and use a good approximation to the inner sum.

Elementary Prime number theory

Orders of magnitude or arithmetical functions.

Likewise the sum of two squares function

Theorem 12 (Gauss)

Suppose that $x \in \mathbb{R}$ and $x \ge 2$. Then

$$\sum_{n\leq X}r(n)=\pi X+O(X^{1/2}).$$

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

• Likewise the sum of two squares function

Theorem 12 (Gauss)

Suppose that $x \in \mathbb{R}$ and $x \ge 2$. Then

$$\sum_{n\leq X}r(n)=\pi X+O(X^{1/2}).$$

Again we leave the proof as an exercise. As a hint, there is
a general principal which is easy to prove in this case that
the number of lattice points in a convex region is equal to
the area of the region with an error proportional to the
length of the boundary.

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

• Gauss suggested that a good approximation to $\pi(x)$, the number of primes not exceeding x, is

$$\operatorname{li}(x) = \int_2^x \frac{dt}{\log t}.$$

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

• Gauss suggested that a good approximation to $\pi(x)$, the number of primes not exceeding x, is

$$\operatorname{li}(x) = \int_2^x \frac{dt}{\log t}.$$

• He also carried out some calculations for $x \le 1000$. Today we have much more extensive calculations.

 The strongest results we know about the distribution of primes use complex analytic methods. Robert C. Vaughan

Arithmetica Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

- The strongest results we know about the distribution of primes use complex analytic methods.
- However there are some very useful and basic results that can be established elementarily.

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

- The strongest results we know about the distribution of primes use complex analytic methods.
- However there are some very useful and basic results that can be established elementarily.
- Many expositions of the results we are going to describe use nothing more than properties of binomial coefficients, but it is good to start to get the flavour of more sophisticated methods even though here they could be interpreted as just properties of binomial coefficients.

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude or arithmetical functions.

We start by introducing The von Mangold function.
 This is defined by

$$\Lambda(n) = \begin{cases} 0 & \text{if } p_1 p_2 | n \text{ with } p_1 \neq p_2, \\ \log p & \text{if } n = p^k. \end{cases}$$

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

We start by introducing The von Mangold function.
 This is defined by

$$\Lambda(n) = \begin{cases} 0 & \text{if } p_1 p_2 | n \text{ with } p_1 \neq p_2, \\ \log p & \text{if } n = p^k. \end{cases}$$

• The interesting thing is that the support of Λ is on the prime powers, the higher powers are quite rare, at most \sqrt{x} of them not exceeding x.

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

We start by introducing The von Mangold function.
 This is defined by

$$\Lambda(n) = \begin{cases} 0 & \text{if } p_1 p_2 | n \text{ with } p_1 \neq p_2, \\ \log p & \text{if } n = p^k. \end{cases}$$

- The interesting thing is that the support of Λ is on the prime powers, the higher powers are quite rare, at most \sqrt{x} of them not exceeding x.
- This function is definitely not multiplicative, since $\Lambda(1) = 0$.

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

 However the von Mangoldt function does satisfy some interesting relationships.

Lemma 13

Let
$$n \in \mathbb{N}$$
. Then $\sum_{m|n} \Lambda(m) = \log n$.

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

 However the von Mangoldt function does satisfy some interesting relationships.

Lemma 13

Let $n \in \mathbb{N}$. Then $\sum_{m|n} \Lambda(m) = \log n$.

• The proof is a simple counting argument.

Proof.

Write $n=p_1^{k_1}\dots p_r^{k_r}$ with the p_j distinct. Then for a non-zero contribution to the sum we have $m=p_s^{j_s}$ for some s with $1 \le s \le r$ and j_s with $1 \le j_s \le k_s$. Thus the sum is

$$\sum_{s=1}^{r} \sum_{i=1}^{k_s} \log p_s = \log n.$$

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

• We need to know something about the average of $\log n$.

Lemma 14 (Stirling)

Suppose that $X \in \mathbb{R}$ and $X \geq 2$. Then

$$\sum_{n \le X} \log n = X(\log X - 1) + O(\log X).$$

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude or arithmetical functions.

• This can be thought of as the logarithm of Stirling's formula for |X|!.

Proof.

We have

$$\sum_{n \le X} \log n = \sum_{n \le X} \left(\log X - \int_{n}^{X} \frac{dt}{t} \right)$$

$$= \lfloor X \rfloor \log X - \int_{1}^{X} \frac{\lfloor t \rfloor}{t} dt$$

$$= X(\log X - 1) + \int_{1}^{X} \frac{t - \lfloor t \rfloor}{t} dt + O(\log X).$$

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

 Now we can say something about averages of the von Mangoldt function.

Theorem 15

Suppose that $X \in \mathbb{R}$ and $X \geq 2$. Then

$$\sum_{m \le X} \Lambda(m) \left\lfloor \frac{X}{m} \right\rfloor = X(\log X - 1) + O(\log X).$$

Elementary Prime number theory

Orders of magnitude or arithmetical functions.

 Now we can say something about averages of the von Mangoldt function.

Theorem 15

Suppose that $X \in \mathbb{R}$ and $X \geq 2$. Then

$$\sum_{m \le X} \Lambda(m) \left\lfloor \frac{X}{m} \right\rfloor = X(\log X - 1) + O(\log X).$$

• This is easy

Proof.

We substitute from the first lemma into the second. Thus

$$\sum_{n\leq X}\sum_{m|n}\Lambda(m)=X(\log X-1)+O(\log X).$$

Now we interchange the order in the double sum and count the number of multiples of m not exceeding X.

 At this stage it is necessary to introduce some of the fundamental counting functions of prime number theory.

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

- At this stage it is necessary to introduce some of the fundamental counting functions of prime number theory.
- For $X \ge 0$ we define

$$\psi(X) = \sum_{n \le X} \Lambda(n),$$

$$\psi(X) = \sum_{p \le X} \log p,$$

$$\pi(X) = \sum_{p \le X} 1.$$

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

 The following theorem shows the close relationship between these three functions.

Theorem 16

Suppose that $X \geq 2$. Then

$$\psi(X) = \sum_{k} \vartheta(X^{1/k}),$$

$$\vartheta(X) = \sum_{k} \mu(k)\psi(X^{1/k}),$$

$$\pi(X) = \frac{\vartheta(X)}{\log X} + \int_{2}^{X} \frac{\vartheta(t)}{t \log^{2} t} dt,$$

$$\vartheta(X) = \pi(X) \log X - \int_{2}^{X} \frac{\pi(t)}{t} dt.$$

Note that each of these functions are 0 when X < 2, so the sums are all finite.

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

We prove

$$\psi(X) = \sum_{k} \vartheta(X^{1/k}),$$

$$\vartheta(X) = \sum_{k} \mu(k)\psi(X^{1/k}),$$

$$\pi(X) = \frac{\vartheta(X)}{\log X} + \int_{2}^{X} \frac{\vartheta(t)}{t \log^{2} t} dt,$$

$$\vartheta(X) = \pi(X) \log X - \int_{2}^{X} \frac{\pi(t)}{t} dt.$$

Robert C. Vaughan

Arithmetica Functions

Averages of arithmetica functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

We prove

$$\psi(X) = \sum_{k} \vartheta(X^{1/k}),$$

$$\vartheta(X) = \sum_{k} \mu(k)\psi(X^{1/k}),$$

$$\pi(X) = \frac{\vartheta(X)}{\log X} + \int_{2}^{X} \frac{\vartheta(t)}{t \log^{2} t} dt,$$

$$\vartheta(X) = \pi(X) \log X - \int_{2}^{X} \frac{\pi(t)}{t} dt.$$

By the definition of Λ we have

$$\psi(X) = \sum_{k} \sum_{p \leq X^{1/k}} \log p = \sum_{k} \vartheta(X^{1/k}).$$

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

We prove

$$\psi(X) = \sum_{k} \vartheta(X^{1/k}),$$

$$\vartheta(X) = \sum_{k} \mu(k)\psi(X^{1/k}),$$

$$\pi(X) = \frac{\vartheta(X)}{\log X} + \int_{2}^{X} \frac{\vartheta(t)}{t \log^{2} t} dt,$$

$$\vartheta(X) = \pi(X) \log X - \int_{2}^{X} \frac{\pi(t)}{t} dt.$$

• By the definition of Λ we have

$$\psi(X) = \sum_{k} \sum_{p < X^{1/k}} \log p = \sum_{k} \vartheta(X^{1/k}).$$

Hence we have

$$\sum_{k} \mu(k)\psi(X^{1/k}) = \sum_{k} \mu(k) \sum_{l} \vartheta(X^{1/(kl)}).$$

Robert C. Vaughan

Arithmetica Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions

 Collecting together the terms for which kl = m for a given m this becomes

$$\sum_{m} \vartheta(X^{1/m}) \sum_{k|m} \mu(k) = \vartheta(X).$$

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

 Collecting together the terms for which kl = m for a given m this becomes

$$\sum_{m} \vartheta(X^{1/m}) \sum_{k|m} \mu(k) = \vartheta(X).$$

• We also have

$$\pi(X) = \sum_{p \le X} (\log p) \left(\frac{1}{\log X} + \int_{p}^{X} \frac{dt}{t \log^{2} t} \right)$$
$$= \frac{\vartheta(X)}{\log X} + \int_{2}^{X} \frac{\vartheta(t)}{t \log^{2} t} dt.$$

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

 Collecting together the terms for which kl = m for a given m this becomes

$$\sum_m \vartheta(X^{1/m}) \sum_{k|m} \mu(k) = \vartheta(X).$$

• We also have

$$\pi(X) = \sum_{p \le X} (\log p) \left(\frac{1}{\log X} + \int_{p}^{X} \frac{dt}{t \log^{2} t} \right)$$
$$= \frac{\vartheta(X)}{\log X} + \int_{2}^{X} \frac{\vartheta(t)}{t \log^{2} t} dt.$$

• The final identity is similar.

$$\vartheta(X) = \sum_{p \le X} \log X - \sum_{p \le X} \int_{p}^{X} \frac{dt}{t}$$

etcetera.

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude o arithmetical

 Now we come to a series of theorems which are still used frequently.

Theorem 17 (Chebyshev)

There are positive constants C_1 and C_2 such that for each $X \in \mathbb{R}$ with $X \geq 2$ we have

$$C_1X < \psi(X) < C_2X.$$

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

 Now we come to a series of theorems which are still used frequently.

Theorem 17 (Chebyshev)

There are positive constants C_1 and C_2 such that for each $X \in \mathbb{R}$ with $X \geq 2$ we have

$$C_1X < \psi(X) < C_2X.$$

ullet Proof. For any $heta \in \mathbb{R}$ let

$$f(\theta) = \lfloor \theta \rfloor - 2 \left\lfloor \frac{\theta}{2} \right\rfloor.$$

Then f is periodic with period 2 and

$$f(\theta) = \begin{cases} 0 & (0 \le \theta < 1), \\ 1 & (1 \le \theta < 2). \end{cases}$$

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

Hence

$$\psi(X) \ge \sum_{n \le X} \Lambda(n) f(X/n)$$

$$= \sum_{n \le X} \Lambda(n) \left\lfloor \frac{X}{n} \right\rfloor - 2 \sum_{n \le X/2} \Lambda(n) \left\lfloor \frac{X/2}{n} \right\rfloor.$$

Robert C. Vaughan

Arithmetica Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

Hence

$$\psi(X) \ge \sum_{n \le X} \Lambda(n) f(X/n)$$

$$= \sum_{n \le X} \Lambda(n) \left\lfloor \frac{X}{n} \right\rfloor - 2 \sum_{n \le X/2} \Lambda(n) \left\lfloor \frac{X/2}{n} \right\rfloor.$$

• Here we used the fact that there is no contribution to the second sum when $X/2 < n \le X$.

Robert C Vaughan

Arithmetica Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

Hence

$$\psi(X) \ge \sum_{n \le X} \Lambda(n) f(X/n)$$

$$= \sum_{n \le X} \Lambda(n) \left\lfloor \frac{X}{n} \right\rfloor - 2 \sum_{n \le X/2} \Lambda(n) \left\lfloor \frac{X/2}{n} \right\rfloor.$$

- Here we used the fact that there is no contribution to the second sum when $X/2 < n \le X$.
- Now we apply Theorem 15 and obtain for $x \ge 4$

$$X(\log X - 1) - 2\frac{X}{2} \left(\log \frac{X}{2} - 1\right) + O(\log X)$$

= $X \log 2 + O(\log X)$.

Robert C Vaughan

Arithmetica Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

Hence

$$\psi(X) \ge \sum_{n \le X} \Lambda(n) f(X/n)$$

$$= \sum_{n \le X} \Lambda(n) \left\lfloor \frac{X}{n} \right\rfloor - 2 \sum_{n \le X/2} \Lambda(n) \left\lfloor \frac{X/2}{n} \right\rfloor.$$

- Here we used the fact that there is no contribution to the second sum when $X/2 < n \le X$.
- Now we apply Theorem 15 and obtain for $x \ge 4$

$$X(\log X - 1) - 2\frac{X}{2} \left(\log \frac{X}{2} - 1\right) + O(\log X)$$

= $X \log 2 + O(\log X)$.

• This establishes the first inequality of the theorem for all X > C for some positive constant C. Since $\psi(X) \ge \log 2$ for all $X \ge 2$ the conclusion follows if C_1 is small enough.

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

• We also have, for $X \ge 4$,

$$\psi(X) - \psi(X/2) \le \sum_{n \le X} \Lambda(n) f(X/n)$$

and we have already seen that this is

$$X\log 2 + O(\log X).$$

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

• We also have, for $X \ge 4$,

$$\psi(X) - \psi(X/2) \le \sum_{n \le X} \Lambda(n) f(X/n)$$

and we have already seen that this is

$$X\log 2 + O(\log X).$$

• Hence for some positive constant C we have, for all X > 0,

$$\psi(X) - \psi(X/2) \le CX.$$

Hence, for any $k \ge 0$,

$$\psi(X2^{-k}) - \psi(X2^{-k-1}) < CX2^{-k}$$
.

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

• We also have, for $X \ge 4$,

$$\psi(X) - \psi(X/2) \le \sum_{n \le X} \Lambda(n) f(X/n)$$

and we have already seen that this is

$$X \log 2 + O(\log X).$$

• Hence for some positive constant C we have, for all X > 0,

$$\psi(X) - \psi(X/2) \le CX.$$

Hence, for any $k \ge 0$,

$$\psi(X2^{-k}) - \psi(X2^{-k-1}) < CX2^{-k}$$
.

• Summing over all *k* gives the desired upper bound.

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

 The following now follow easily from the last couple of theorems.

Corollary 18 (Chebyshev)

There are positive constants C_3 , C_4 , C_5 , C_6 such that for every $X \ge 2$ we have

$$\begin{aligned} &C_3X < \vartheta(X) < C_4X, \\ &\frac{C_5X}{\log X} < \pi(X) < \frac{C_6X}{\log X}. \end{aligned}$$

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

 It is also possible to establish a more precise version of Euler's result on the primes.

Theorem 19 (Mertens)

There is a constant B such that whenever $X \ge 2$ we have

$$\sum_{n \le X} \frac{\Lambda(n)}{n} = \log X + O(1),$$

$$\sum_{p \le X} \frac{\log p}{p} = \log X + O(1),$$

$$\sum_{p \le X} \frac{1}{p} = \log \log X + B + O\left(\frac{1}{\log X}\right).$$

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

 It is also possible to establish a more precise version of Euler's result on the primes.

Theorem 19 (Mertens)

There is a constant B such that whenever $X \ge 2$ we have

$$\sum_{n \le X} \frac{\Lambda(n)}{n} = \log X + O(1),$$

$$\sum_{p \le X} \frac{\log p}{p} = \log X + O(1),$$

$$\sum_{p \le X} \frac{1}{p} = \log \log X + B + O\left(\frac{1}{\log X}\right).$$

• I don't want to spend time on the proof, but it is given below and you can see it in the files if you are interested.

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude or arithmetical functions.

Proof By Theorem 15 we have

$$\sum_{m \le X} \Lambda(m) \left\lfloor \frac{X}{m} \right\rfloor = X(\log X - 1) + O(\log X).$$

Arithmetica Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

Proof By Theorem 15 we have

$$\sum_{m \le X} \Lambda(m) \left\lfloor \frac{X}{m} \right\rfloor = X(\log X - 1) + O(\log X).$$

• The left hand side is

$$X\sum_{m\leq X}\frac{\Lambda(m)}{m}+O(\psi(X)).$$

Elementary Prime number theory

Orders of magnitude of arithmetical functions

Proof By Theorem 15 we have

$$\sum_{m \le X} \Lambda(m) \left\lfloor \frac{X}{m} \right\rfloor = X(\log X - 1) + O(\log X).$$

• The left hand side is

$$X\sum_{m\leq X}\frac{\Lambda(m)}{m}+O(\psi(X)).$$

Hence by Cheyshev's theorem we have

$$X\sum_{m\leq X}\frac{\Lambda(m)}{m}=X\log X+O(X).$$

Orders of magnitude or arithmetical functions.

Proof By Theorem 15 we have

$$\sum_{m \le X} \Lambda(m) \left\lfloor \frac{X}{m} \right\rfloor = X(\log X - 1) + O(\log X).$$

• The left hand side is

$$X\sum_{m\leq X}\frac{\Lambda(m)}{m}+O(\psi(X)).$$

Hence by Cheyshev's theorem we have

$$X \sum_{m \le X} \frac{\Lambda(m)}{m} = X \log X + O(X).$$

• Dividing by X gives the first result.

Elementary Prime number theory

Orders of magnitude of arithmetical functions

We also have

$$\sum_{m \le X} \frac{\Lambda(m)}{m} = \sum_{k} \sum_{p^k \le X} \frac{\log p}{p^k}$$

Elementary Prime number theory

Orders of magnitude o arithmetical functions

We also have

$$\sum_{m \le X} \frac{\Lambda(m)}{m} = \sum_{k} \sum_{p^k \le X} \frac{\log p}{p^k}.$$

• The terms with $k \ge 2$ contribute

$$\leq \sum_{p} \sum_{k>2} \frac{\log p}{p^k} \leq \sum_{n=2}^{\infty} \frac{\log n}{n(n-1)}$$

which is convergent, and this gives the second expression.

Arithmetica Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

Finally we can see that

$$\begin{split} \sum_{p \leq X} \frac{1}{p} &= \sum_{p \leq X} \frac{\log p}{p} \left(\frac{1}{\log X} + \int_{p}^{X} \frac{dt}{t \log^{2} t} \right) \\ &= \frac{1}{\log X} \sum_{p \leq X} \frac{\log p}{p} + \int_{2}^{X} \sum_{p \leq t} \frac{\log p}{p} \frac{dt}{t \log^{2} t}. \end{split}$$

Arithmetica Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude or arithmetical functions.

Finally we can see that

$$\sum_{p \le X} \frac{1}{p} = \sum_{p \le X} \frac{\log p}{p} \left(\frac{1}{\log X} + \int_{p}^{X} \frac{dt}{t \log^{2} t} \right)$$
$$= \frac{1}{\log X} \sum_{p \le X} \frac{\log p}{p} + \int_{2}^{X} \sum_{p \le t} \frac{\log p}{p} \frac{dt}{t \log^{2} t}.$$

• $E(t) = \sum_{p \le t} \frac{\log p}{p} - \log t$ so that by the second part of the theorem we have $E(t) \ll 1$.

Arithmetica Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

Finally we can see that

$$\sum_{p \le X} \frac{1}{p} = \sum_{p \le X} \frac{\log p}{p} \left(\frac{1}{\log X} + \int_{p}^{X} \frac{dt}{t \log^{2} t} \right)$$
$$= \frac{1}{\log X} \sum_{p \le X} \frac{\log p}{p} + \int_{2}^{X} \sum_{p \le t} \frac{\log p}{p} \frac{dt}{t \log^{2} t}.$$

- $E(t) = \sum_{p \le t} \frac{\log p}{p} \log t$ so that by the second part of the theorem we have $E(t) \ll 1$.
- Then the above is

$$= \frac{\log X + E(X)}{\log X} + \int_2^X \frac{\log t + E(t)}{t \log^2 t} dt$$

$$= \log \log X + 1 - \log \log 2 + \int_2^\infty \frac{E(t)}{t \log^2 t} dt$$

$$+ \frac{E(X)}{\log X} - \int_X^\infty \frac{E(t)}{t \log^2 t} dt.$$

Arithmetica Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

Finally we can see that

$$\sum_{p \le X} \frac{1}{p} = \sum_{p \le X} \frac{\log p}{p} \left(\frac{1}{\log X} + \int_{p}^{X} \frac{dt}{t \log^{2} t} \right)$$
$$= \frac{1}{\log X} \sum_{p \le X} \frac{\log p}{p} + \int_{2}^{X} \sum_{p \le t} \frac{\log p}{p} \frac{dt}{t \log^{2} t}.$$

- $E(t) = \sum_{p \le t} \frac{\log p}{p} \log t$ so that by the second part of the theorem we have $E(t) \ll 1$.
- Then the above is

$$= \frac{\log X + E(X)}{\log X} + \int_2^X \frac{\log t + E(t)}{t \log^2 t} dt$$

$$= \log \log X + 1 - \log \log 2 + \int_2^\infty \frac{E(t)}{t \log^2 t} dt$$

$$+ \frac{E(X)}{\log X} - \int_X^\infty \frac{E(t)}{t \log^2 t} dt.$$

The first integral converges and the last two terms are

$$\leq \frac{1}{\log X}$$

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

Another theorem which can be deduced is the following.

Theorem 20 (Mertens)

We have

$$\prod_{p < X} \left(1 - \frac{1}{p} \right)^{-1} = e^{C} \log X + O(1).$$

Elementary Prime number theory

Orders of magnitude of arithmetical functions

• Another theorem which can be deduced is the following.

Theorem 20 (Mertens)

We have

$$\prod_{p < X} \left(1 - \frac{1}{p} \right)^{-1} = e^{C} \log X + O(1).$$

• I do not give the proof here. In practice the third estimate in the previous theorem is usually adequate.

- By the way, there is some connection with the divisor function. It is not hard to show that $2^{\omega(n)} \le d(n) \le 2^{\Omega(n)}$.
- In fact this is a simple consequence of the chain of inequalities $2 \le k + 1 \le 2^k$.

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

 We can now establish that the average number of prime divisors of a number n is log log n.

Theorem 21

Suppose that $X \ge 2$. Then

$$\sum_{n \le X} \omega(n) = X \log \log X + BX + O\left(\frac{X}{\log X}\right)$$

where B is the constant of Theorem 19, and

$$\sum_{n\leq X}\Omega(n)=$$

$$X \log \log X + \left(B + \sum_{p} \frac{1}{p(p-1)}\right) X + O\left(\frac{X}{\log X}\right).$$

Elementary Prime number theory

Orders of magnitude or arithmetical functions.

• We skip the proof.

Proof.

We have

$$\sum_{n \le X} \omega(n) = \sum_{n \le X} \sum_{p \mid n} 1 = \sum_{p \le X} \left\lfloor \frac{X}{p} \right\rfloor$$
$$= X \sum_{p \le X} \frac{1}{p} + O(\pi(x))$$

and the result follows by combining Corollary 18 and Theorem 19.

The case of Ω is similar.

Arithmetica Functions

Averages of arithmetica functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

• Hardy and Ramanujan made the remarkable discovery that $\log \log n$ is not just the average of $\omega(n)$, but is its normal order.

Arithmetica Functions

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

- Hardy and Ramanujan made the remarkable discovery that $\log \log n$ is not just the average of $\omega(n)$, but is its normal order.
- Later Turán found a simple proof of this.

Theorem 22 (Hardy & Ramanujan)

Suppose that $X \ge 2$. Then

$$\sum_{n\leq X} \left(\omega(n) - \sum_{p\leq X} \frac{1}{p}\right)^2 \ll X \sum_{p\leq X} \frac{1}{p},$$

$$\sum_{n \le X} (\omega(n) - \log \log X)^2 \ll X \log \log X$$

and

$$\sum_{2 \le n \le X} (\omega(n) - \log\log n)^2 \ll X \log\log X$$

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

 First we show the equivalence of the results. It follows easily from Mertens that

$$\sum_{n\leq X} \left(\sum_{p\leq X} \frac{1}{p} - \log\log X\right)^2 \ll X.$$

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude or arithmetical functions.

• First we show the equivalence of the results. It follows easily from Mertens that

$$\sum_{n\leq X} \left(\sum_{p\leq X} \frac{1}{p} - \log\log X\right)^2 \ll X.$$

Moreover

$$\sum_{\sqrt{X} < n \le X} (\log \log X - \log \log n)^2 \le \sum_{2 \le n \le X} \left(\log \frac{\log X}{\log \sqrt{X}} \right)^2$$

$$\ll \sum_{n \le X} (\log 2)^2$$

and

$$\sum_{2 \le n \le \sqrt{X}} (\log \log X - \log \log n)^2 \ll (\log \log X)^2 \sqrt{X}.$$

Math 571 Chapter 1 Elementary Results

Robert C. Vaughan

Arithmetica Functions

Averages of arithmetica functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions

• Thus it suffices to prove the second statement in the theorem.

Averages of arithmetica functions

Elementary Prime number theory

- Thus it suffices to prove the second statement in the theorem.
- We have

$$\sum_{n \le X} \omega(n)^2 = \sum_{\substack{p_1 \le X \\ p_2 \ne p_1}} \sum_{\substack{p_2 \le X \\ p_2 \ne p_1}} \left\lfloor \frac{X}{p_1 p_2} \right\rfloor + \sum_{\substack{p \le X \\ p}} \left\lfloor \frac{X}{p} \right\rfloor$$
$$\le X(\log \log X)^2 + O(X \log \log X).$$

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude o arithmetical functions.

- Thus it suffices to prove the second statement in the theorem.
- We have

$$\sum_{n \le X} \omega(n)^2 = \sum_{\substack{p_1 \le X \\ p_2 \ne p_1}} \left\lfloor \frac{X}{p_1 p_2} \right\rfloor + \sum_{\substack{p \le X \\ p}} \left\lfloor \frac{X}{p} \right\rfloor$$
$$\le X(\log \log X)^2 + O(X \log \log X).$$

Hence

$$\sum_{n \le X} (\omega(n) - \log \log X)^2 \le 2X (\log \log X)^2$$
$$-2(\log \log X) \sum_{n \le X} \omega(n) + O(X \log \log X)$$

and this is $\ll X \log \log X$.

Orders of magnitude of arithmetical functions.

• Recall that $d(n) = (k_1 + 1) \dots (k_r + 1)$.

Averages of arithmetica functions

Elementary Prime numbe theory

Orders of magnitude of arithmetical functions.

- Recall that $d(n) = (k_1 + 1) \dots (k_r + 1)$.
- Thus

$$\frac{d(n)}{n^{\varepsilon}} = \prod_{j=1}^{r} \frac{k_j + 1}{p_j^{\varepsilon k_j}}$$

Averages of arithmetical functions

Elementary Prime numbe theory

Orders of magnitude of arithmetical functions.

- Recall that $d(n) = (k_1 + 1) \dots (k_r + 1)$.
- Thus

$$\frac{d(n)}{n^{\varepsilon}} = \prod_{j=1}^{r} \frac{k_j + 1}{p_j^{\varepsilon k_j}}.$$

• Since we are only interested in an upper bound, the terms for which $\rho_j^{\varepsilon} > 2$ can be thrown away since $2^k \ge k + 1$.

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

- Recall that $d(n) = (k_1 + 1) \dots (k_r + 1)$.
- Thus

$$\frac{d(n)}{n^{\varepsilon}} = \prod_{j=1}^{r} \frac{k_j + 1}{p_j^{\varepsilon k_j}}.$$

- Since we are only interested in an upper bound, the terms for which $p_i^{\varepsilon} > 2$ can be thrown away since $2^k \ge k + 1$.
- However there are only $\leq 2^{1/\varepsilon}$ primes p_i for which

$$p_j^{\varepsilon} \leq 2$$
.

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

- Recall that $d(n) = (k_1 + 1) \dots (k_r + 1)$.
- Thus

$$\frac{d(n)}{n^{\varepsilon}} = \prod_{j=1}^{r} \frac{k_j + 1}{p_j^{\varepsilon k_j}}.$$

- Since we are only interested in an upper bound, the terms for which $p_i^{\varepsilon} > 2$ can be thrown away since $2^k \ge k + 1$.
- However there are only $\leq 2^{1/\varepsilon}$ primes p_i for which

$$p_j^{\varepsilon} \leq 2.$$

Morever for any such prime we have

$$p_j^{\varepsilon k_j} \ge 2^{\varepsilon k_j} = \exp(\varepsilon k_j \log 2)$$

 $\ge 1 + \varepsilon k_i \log 2 \ge (k_i + 1)\varepsilon \log 2.$

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

- Recall that $d(n) = (k_1 + 1) \dots (k_r + 1)$.
- Thus

$$\frac{d(n)}{n^{\varepsilon}} = \prod_{j=1}^{r} \frac{k_j + 1}{p_j^{\varepsilon k_j}}.$$

- Since we are only interested in an upper bound, the terms for which $p_i^{\varepsilon} > 2$ can be thrown away since $2^k \ge k + 1$.
- However there are only $\leq 2^{1/\varepsilon}$ primes p_i for which

$$p_j^{\varepsilon} \leq 2$$
.

Morever for any such prime we have

$$p_j^{\varepsilon k_j} \ge 2^{\varepsilon k_j} = \exp(\varepsilon k_j \log 2)$$

 $\ge 1 + \varepsilon k_i \log 2 \ge (k_i + 1)\varepsilon \log 2.$

Thus

$$\frac{d(n)}{n^{\varepsilon}} \leq \left(\frac{1}{\varepsilon \log 2}\right)^{2^{1/\varepsilon}}.$$

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

 The above proof can be refined to give a companion to Theorem 23

Theorem 25

Let $\varepsilon > 0$. Then for all $n > n_0$ we have

$$d(n) < \exp\left(\frac{(\log 2 + \varepsilon) \log n}{\log \log n}\right).$$

Prime number theory

Orders of magnitude of arithmetical functions.

 The above proof can be refined to give a companion to Theorem 23

Theorem 25

Let $\varepsilon > 0$. Then for all $n > n_0$ we have

$$d(n) < \exp\left(\frac{(\log 2 + \varepsilon)\log n}{\log\log n}\right).$$

• We follow the proof of the previous theorem until the final inequality. Then replace the ε there with

$$\frac{(1+\varepsilon/2)\log 2}{\log\log n}$$

which for large n certainly meets the requirement of being no larger than $1/\log 2$.

Averages of arithmetical functions

Elementary Prime number theory

Orders of magnitude of arithmetical functions.

Now

$$\begin{split} &\left(\frac{1}{\varepsilon \log 2}\right)^{2^{1/\varepsilon}} \\ &= \exp\left(\exp\left(\frac{\log \log n}{1 + \varepsilon/2}\right) \log \frac{\log \log n}{(1 + \varepsilon/2) \log 2}\right) \\ &< \exp\left(\frac{\varepsilon (\log n) \log 2}{2 \log \log n}\right) \end{split}$$

for sufficiently large n. Hence

$$d(n) < n^{\frac{(1+\varepsilon/2)\log 2}{\log\log n}} \exp\left(\frac{\varepsilon(\log n)\log 2}{2\log\log n}\right)$$

$$= \exp\left(\frac{(1+\varepsilon)(\log n)\log 2}{\log\log n}\right)$$

$$< \exp\left(\frac{(\log 2 + \varepsilon)(\log n)}{\log\log n}\right).$$
